§1 X<sub>E</sub>T<sub>E</sub>X PART 1: INTRODUCTION

3

June 11, 2023 at 13:14

The present implementation has a long ancestry, beginning in the summer of 1977, when Michael F. Plass and Frank M. Liang designed and coded a prototype based on some specifications that the author had made in May of that year. This original protoTFX included macro definitions and elementary manipulations on boxes and glue, but it did not have line-breaking, page-breaking, mathematical formulas, alignment routines, error recovery, or the present semantic nest; furthermore, it used character lists instead of token lists, so that a control sequence like \halign was represented by a list of seven characters. A complete version of T<sub>F</sub>X was designed and coded by the author in late 1977 and early 1978; that program, like its prototype, was written in the SAIL language, for which an excellent debugging system was available. Preliminary plans to convert the SAIL code into a form somewhat like the present "web" were developed by Luis Trabb Pardo and the author at the beginning of 1979, and a complete implementation was created by Ignacio A. Zabala in 1979 and 1980. The T<sub>F</sub>X82 program, which was written by the author during the latter part of 1981 and the early part of 1982, also incorporates ideas from the 1979 implementation of T<sub>F</sub>X in MESA that was written by Leonidas Guibas, Robert Sedgewick, and Douglas Wyatt at the Xerox Palo Alto Research Center. Several hundred refinements were introduced into TFX82 based on the experiences gained with the original implementations, so that essentially every part of the system has been substantially improved. After the appearance of "Version 0" in September 1982, this program benefited greatly from the comments of many other people, notably David R. Fuchs and Howard W. Trickey. A final revision in September 1989 extended the input character set to eight-bit codes and introduced the ability to hyphenate words from different languages, based on some ideas of Michael J. Ferguson.

No doubt there still is plenty of room for improvement, but the author is firmly committed to keeping T<sub>E</sub>X82 "frozen" from now on; stability and reliability are to be its main virtues.

On the other hand, the WEB description can be extended without changing the core of TEX82 itself, and the program has been designed so that such extensions are not extremely difficult to make. The *banner* string defined here should be changed whenever TEX undergoes any modifications, so that it will be clear which version of TEX might be the guilty party when a problem arises.

This program contains code for various features extending T<sub>E</sub>X, therefore this program is called 'X<sub>\textstarteq</sub>T<sub>E</sub>X' and not 'T<sub>E</sub>X'; the official name 'T<sub>E</sub>X' by itself is reserved for software systems that are fully compatible with each other. A special test suite called the "TRIP test" is available for helping to determine whether a particular implementation deserves to be known as 'T<sub>E</sub>X' [cf. Stanford Computer Science report CS1027, November 1984].

MLTEX will add new primitives changing the behaviour of TeX. The *banner* string has to be changed. We do not change the *banner* string, but will output an additional line to make clear that this is a modified TeX version.

A similar test suite called the "e-TRIP test" is available for helping to determine whether a particular implementation deserves to be known as ' $\varepsilon$ -TEX'.

```
 \begin{array}{lll} \textbf{define} & eTeX\_version = 2 & \{ \egno{array}{l} & eTeX\_version = ".6" & \{ \egno{array}{l} & eTeX\_version = ".6" & \{ \egno{array}{l} & eTeX\_version = 0 & \{ \egno{array}{l} & eTeX\_version \} \\ \textbf{define} & & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & \\ & & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & & \\ & & & \\ & & \\ & & & \\ & & \\ & & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & &

define eTeX-states = 12 { number of \varepsilon-TFX state variables in eqtb }
```

4.\* The program begins with a normal Pascal program heading, whose components will be filled in later, using the conventions of WEB. For example, the portion of the program called '(Global variables 13)' below will be replaced by a sequence of variable declarations that starts in §13 of this documentation. In this way, we are able to define each individual global variable when we are prepared to understand what it means; we do not have to define all of the globals at once. Cross references in §13, where it says "See also sections 20, 26, ...," also make it possible to look at the set of all global variables, if desired. Similar remarks apply to the other portions of the program heading.

```
define mtype \equiv t@\&y@\&p@\&e { this is a WEB coding trick: }
  format mtype \equiv type { 'mtype' will be equivalent to 'type'}
  format type \equiv true \quad \{ \text{ but '}type' \text{ will not be treated as a reserved word } \}
(Compiler directives 9)
program TEX; { all file names are defined dynamically }
  const (Constants in the outer block 11*)
  mtype \langle Types in the outer block 18\rangle
  var (Global variables 13)
  procedure initialize; { this procedure gets things started properly }
    var \langle Local variables for initialization 19* \rangle
    begin (Initialize whatever T<sub>E</sub>X might access 8*)
    end:
  (Basic printing procedures 57)
  (Error handling procedures 82)
```

6.\* For Web2c, labels are not declared in the main program, but we still have to declare the symbolic names.

```
define start\_of\_TEX = 1 { go here when TFX's variables are initialized }
define final\_end = 9999 { this label marks the ending of the program }
```

§7 X<sub>E</sub>T<sub>E</sub>X PART 1: INTRODUCTION

5

7.\* Some of the code below is intended to be used only when diagnosing the strange behavior that sometimes occurs when TeX is being installed or when system wizards are fooling around with TeX without quite knowing what they are doing. Such code will not normally be compiled; it is delimited by the codewords 'debug...gubed', with apologies to people who wish to preserve the purity of English.

Similarly, there is some conditional code delimited by 'stat ... tats' that is intended for use when statistics are to be kept about TEX's memory usage. The stat ... tats code also implements diagnostic information for \tracingparagraphs, \tracingpages, and \tracingrestores.

```
define debug \equiv ifdef ('TEXMF_DEBUG') define gubed \equiv endif ('TEXMF_DEBUG') format debug \equiv begin format gubed \equiv end define stat \equiv ifdef ('STAT') define tats \equiv endif ('STAT') format stat \equiv begin format tats \equiv end
```

8.\* This program has two important variations: (1) There is a long and slow version called INITEX, which does the extra calculations needed to initialize TEX's internal tables; and (2) there is a shorter and faster production version, which cuts the initialization to a bare minimum. Parts of the program that are needed in (1) but not in (2) are delimited by the codewords 'init...tini' for declarations and by the codewords 'Init...Tini' for executable code. This distinction is helpful for implementations where a run-time switch differentiates between the two versions of the program.

```
define init \equiv ifdef(\text{`INITEX'})
  define tini \equiv endif(\text{INITEX'})
  define Init \equiv
          init
          if ini_version then
             begin
  define Tini \equiv
          end; tini
  format Init \equiv begin
  format Tini \equiv end
  format init \equiv begin
  format tini \equiv end
\langle \text{ Initialize whatever TFX might access } 8* \rangle \equiv
  (Set initial values of key variables 23*)
  Init (Initialize table entries (done by INITEX only) 189) Tini
See also section 1711*.
This code is used in section 4*.
```

6 PART 1: INTRODUCTION X<sub>H</sub>T<sub>E</sub>X §11

11.\* The following parameters can be changed at compile time to extend or reduce TEX's capacity. They may have different values in INITEX and in production versions of TEX.

```
define file\_name\_size \equiv maxint
  define ssup\_error\_line = 255
  define ssup\_max\_strings \equiv 2097151
              { Larger values than 65536 cause the arrays to consume much more memory. }
  define ssup\_trie\_opcode \equiv 65535
  define ssup\_trie\_size \equiv "3FFFFF
  define ssup\_hyph\_size \equiv 65535 { Changing this requires changing (un)dumping! }
  define iinf\_hyphen\_size \equiv 610 { Must be not less than hyph\_prime! }
  define max\_font\_max = 9000 { maximum number of internal fonts; this can be increased, but
              hash\_size + max\_font\_max should not exceed 29000.}
  define font\_base = 0 { smallest internal font number; must be \geq min\_quarterword; do not change this
              without modifying the dynamic definition of the font arrays.
\langle \text{ Constants in the outer block } 11^* \rangle \equiv
  hash\_offset = 514;  { smallest index in hash array, i.e., hash\_base }
    { Use hash\_offset = 0 for compilers which cannot decrement pointers. }
  trie\_op\_size = 35111;
       { space for "opcodes" in the hyphenation patterns; best if relatively prime to 313, 361, and 1009. }
  neg\_trie\_op\_size = -35111; {for lower trie\_op\_hash array bound; must be equal to -trie\_op\_size.}
  min\_trie\_op = 0; { first possible trie op code for any language }
  max_trie_op = ssup_trie_opcode; { largest possible trie opcode for any language }
  pool_name = TEXMF_POOL_NAME; { this is configurable, for the sake of ML-T<sub>F</sub>X }
    { string of length file_name_size; tells where the string pool appears }
  engine\_name = TEXMF\_ENGINE\_NAME; { the name of this engine }
  inf\_mem\_bot = 0; \ sup\_mem\_bot = 1; \ inf\_main\_memory = 3000; \ sup\_main\_memory = 256000000;
  inf\_trie\_size = 8000; \ sup\_trie\_size = ssup\_trie\_size; \ inf\_max\_strings = 3000;
  sup\_max\_strings = sup\_max\_strings; \ inf\_strings\_free = 100; \ sup\_strings\_free = sup\_max\_strings;
  inf\_buf\_size = 500; sup\_buf\_size = 30000000; inf\_nest\_size = 40; sup\_nest\_size = 4000;
  inf\_max\_in\_open = 6; sup\_max\_in\_open = 127; inf\_param\_size = 60; sup\_param\_size = 32767;

  inf_dvi_buf_size = 800; sup_dvi_buf_size = 65536; inf_font_mem_size = 20000;
  sup\_font\_mem\_size = 147483647;  { integer-limited, so 2 could be prepended? }
  sup\_font\_max = max\_font\_max; inf\_font\_max = 50; {could be smaller, but why?}
  inf\_pool\_size = 32000; \ sup\_pool\_size = 40000000; \ inf\_pool\_free = 1000; \ sup\_pool\_free = sup\_pool\_size;
  inf\_string\_vacancies = 8000; sup\_string\_vacancies = sup\_pool\_size - 23000;
  sup\_hash\_extra = sup\_max\_strings; inf\_hash\_extra = 0; sup\_hyph\_size = ssup\_hyph\_size;
  inf_hyph_size = iinf_hyphen_size; { Must be not less than hyph_prime!}
  inf_{-}expand_{-}depth = 10; sup_{-}expand_{-}depth = 10000000;
This code is used in section 4*.
```

 $\S12$  XaTeX PART 1: INTRODUCTION

12\* Like the preceding parameters, the following quantities can be changed at compile time to extend or reduce TeX's capacity. But if they are changed, it is necessary to rerun the initialization program INITEX to generate new tables for the production TeX program. One can't simply make helter-skelter changes to the following constants, since certain rather complex initialization numbers are computed from them. They are defined here using WEB macros, instead of being put into Pascal's **const** list, in order to emphasize this distinction.

```
define hash\_size = 15000 { maximum number of control sequences; it should be at most about
            (mem\_max - mem\_min)/10; see also font\_max }
define hash_prime = 8501 { a prime number equal to about 85% of hash_size }
define hyph_prime = 607 { another prime for hashing \hyphenation exceptions; if you change this,
            you should also change iinf_hyphen_size.}
define biqqest_char = 65535 { the largest allowed character number; must be \leq max\_quarterword, this
            refers to UTF16 codepoints that we store in strings, etc; actual character codes can exceed
            this range, up to biggest_usv }
define too\_big\_char = 65536 { biggest\_char + 1 }
define biggest_usv = "10FFFF { the largest Unicode Scalar Value }
define too\_big\_usv = "110000  { biggest\_usv + 1 }
define number\_usvs = "110000  { biggest\_usv + 1 }
define special\_char = "110001  { biggest\_usv + 2 }
define biggest\_reg = 255 { the largest allowed register number; must be \leq max\_quarterword }
define number\_regs = 256  { biggest\_reg + 1 }
define font\_biggest = 255 { the real biggest font }
\mathbf{define} \ number\_fonts = font\_biggest - font\_base + 2
define number\_math\_families = 256
\mathbf{define}\ number\_math\_fonts = number\_math\_families + number\_math\_families + number\_math\_families
define math\_font\_biggest = number\_math\_fonts - 1
define text\_size = 0 { size code for the largest size in a family }
define script\_size = number\_math\_families  { size code for the medium size in a family }
\mathbf{define}\ script\_script\_size = number\_math\_families + number\_math\_families
            { size code for the smallest size in a family }
define biggest\_lang = 255 { the largest hyphenation language }
define too\_big\_lang = 256  { biggest\_lang + 1 }
define hyphenatable\_length\_limit = 4095
            { hard limit for hyphenatable length; runtime value is max_hyphenatable_length }
   Here are some macros for common programming idioms.
define negate(\#) \equiv \# \leftarrow -\# { change the sign of a variable }
define loop \equiv \mathbf{while} \ true \ \mathbf{do} \quad \{ \text{ repeat over and over until a } \mathbf{goto} \ \text{happens} \}
format loop \equiv xclause { WEB's xclause acts like 'while true \ do' }
define do\_nothing \equiv \{ \text{ empty statement } \}
define return \equiv \mathbf{goto} \ exit \ \{ \text{terminate a procedure call } \}
format return \equiv nil
define empty = 0 { symbolic name for a null constant }
```

19.\* The original Pascal compiler was designed in the late 60s, when six-bit character sets were common, so it did not make provision for lowercase letters. Nowadays, of course, we need to deal with both capital and small letters in a convenient way, especially in a program for typesetting; so the present specification of TEX has been written under the assumption that the Pascal compiler and run-time system permit the use of text files with more than 64 distinguishable characters. More precisely, we assume that the character set contains at least the letters and symbols associated with ASCII codes '40 through '176; all of these characters are now available on most computer terminals.

Since we are dealing with more characters than were present in the first Pascal compilers, we have to decide what to call the associated data type. Some Pascals use the original name *char* for the characters in text files, even though there now are more than 64 such characters, while other Pascals consider *char* to be a 64-element subrange of a larger data type that has some other name.

In order to accommodate this difference, we shall use the name  $text\_char$  to stand for the data type of the characters that are converted to and from  $ASCII\_code$  when they are input and output. We shall also assume that  $text\_char$  consists of the elements  $chr(first\_text\_char)$  through  $chr(last\_text\_char)$ , inclusive. The following definitions should be adjusted if necessary.

```
define text\_char \equiv ASCII\_code { the data type of characters in text files } define first\_text\_char = 0 { ordinal number of the smallest element of text\_char } define last\_text\_char = biggest\_char { ordinal number of the largest element of text\_char } \( Local variables for initialization 19*\) \equiv i: integer; See also sections 188 and 981. This code is used in section 4*.
```

20\* The TeX processor converts between ASCII code and the user's external character set by means of arrays xord and xchr that are analogous to Pascal's ord and chr functions.

```
\langle Global variables 13\rangle += xchr: \uparrow text\_char; \lbrace dummy variable so tangle doesn't complain; not actually used \rbrace
```

23\* The ASCII code is "standard" only to a certain extent, since many computer installations have found it advantageous to have ready access to more than 94 printing characters. Appendix C of *The TeXbook* gives a complete specification of the intended correspondence between characters and TeX's internal representation.

If  $T_EX$  is being used on a garden-variety Pascal for which only standard ASCII codes will appear in the input and output files, it doesn't really matter what codes are specified in xchr[0...'37], but the safest policy is to blank everything out by using the code shown below.

However, other settings of xchr will make  $T_EX$  more friendly on computers that have an extended character set, so that users can type things like ' $\neq$ ' instead of '\ne'. People with extended character sets can assign codes arbitrarily, giving an xchr equivalent to whatever characters the users of  $T_EX$  are allowed to have in their input files. It is best to make the codes correspond to the intended interpretations as shown in Appendix C whenever possible; but this is not necessary. For example, in countries with an alphabet of more than 26 letters, it is usually best to map the additional letters into codes less than '40. To get the most "permissive" character set, change ' $\Box$ ' on the right of these assignment statements to chr(i).

```
\langle Set initial values of key variables 23*\rangle \equiv
```

```
See also sections 24*, 62, 78*, 81, 84, 101, 122, 191, 241*, 280, 284*, 302, 317, 398, 417, 473, 516, 525, 586*, 591, 629, 632, 642, 687, 696, 704, 727, 819, 941, 982*, 1044, 1087, 1321, 1336, 1355, 1398, 1413, 1517, 1563, 1629, 1648, 1672, 1680*, 1689*, and 1693*.
```

This code is used in section 8\*.

**24**\* The following system-independent code makes the xord array contain a suitable inverse to the information in xchr. Note that if xchr[i] = xchr[j] where i < j < '177, the value of xord[xchr[i]] will turn out to be j or more; hence, standard ASCII code numbers will be used instead of codes below '40 in case there is a coincidence.

```
\langle Set initial values of key variables 23^* \rangle + \equiv
```

26\* Most of what we need to do with respect to input and output can be handled by the I/O facilities that are standard in Pascal, i.e., the routines called get, put, eof, and so on. But standard Pascal does not allow file variables to be associated with file names that are determined at run time, so it cannot be used to implement TEX; some sort of extension to Pascal's ordinary reset and rewrite is crucial for our purposes. We shall assume that name\_of\_file is a variable of an appropriate type such that the Pascal run-time system being used to implement TEX can open a file whose external name is specified by name\_of\_file.

```
\langle Global variables 13\rangle += name\_of\_file: \uparrow UTF8\_code; { we build filenames in utf8 to pass to the OS} name\_of\_file16: \uparrow UTF16\_code; { but sometimes we need a UTF16 version of the name} name\_length: 0 . . file\_name\_size; { this many characters are actually relevant in name\_of\_file (the rest are blank)} name\_length16: 0 . . file\_name\_size;
```

- 27.\* All of the file opening functions are defined in C.
- 28.\* And all the file closing routines as well.
- **30\*** Input from text files is read one line at a time, using a routine called *input\_ln*. This function is defined in terms of global variables called *buffer*, *first*, and *last* that will be described in detail later; for now, it suffices for us to know that *buffer* is an array of *ASCII\_code* values, and that *first* and *last* are indices into this array representing the beginning and ending of a line of text.

```
 \begin{array}{l} \langle \, \text{Global variables} \,\, 13 \,\rangle \,+\!\!\equiv \\ buffer: \,\uparrow UnicodeScalar; \,\,\, \{\, \text{lines of characters being read}\,\} \\ first: \,\, 0 \,\ldots \,\, buf\_size; \,\,\, \{\, \text{the first unused position in} \,\, buffer\,\} \\ last: \,\, 0 \,\ldots \,\, buf\_size; \,\,\, \{\, \text{end of the line just input to} \,\, buffer\,\} \\ max\_buf\_stack: \,\, 0 \,\ldots \,\, buf\_size; \,\,\, \{\, \text{largest index used in} \,\, buffer\,\} \\ \end{array}
```

31.\* The  $input\_ln$  function brings the next line of input from the specified file into available positions of the buffer array and returns the value true, unless the file has already been entirely read, in which case it returns false and sets  $last \leftarrow first$ . In general, the  $ASCII\_code$  numbers that represent the next line of the file are input into buffer[first], buffer[first+1], ..., buffer[last-1]; and the global variable last is set equal to first plus the length of the line. Trailing blanks are removed from the line; thus, either last = first (in which case the line was entirely blank) or  $buffer[last-1] \neq " \sqcup "$ .

An overflow error is given, however, if the normal actions of  $input\_ln$  would make  $last \ge buf\_size$ ; this is done so that other parts of TeX can safely look at the contents of buffer[last + 1] without overstepping the bounds of the buffer array. Upon entry to  $input\_ln$ , the condition  $first < buf\_size$  will always hold, so that there is always room for an "empty" line.

The variable  $max\_buf\_stack$ , which is used to keep track of how large the  $buf\_size$  parameter must be to accommodate the present job, is also kept up to date by  $input\_ln$ .

If the  $bypass\_eoln$  parameter is true,  $input\_ln$  will do a get before looking at the first character of the line; this skips over an eoln that was in  $f\uparrow$ . The procedure does not do a get when it reaches the end of the line; therefore it can be used to acquire input from the user's terminal as well as from ordinary text files.

Standard Pascal says that a file should have *eoln* immediately before *eof*, but  $T_EX$  needs only a weaker restriction: If *eof* occurs in the middle of a line, the system function *eoln* should return a *true* result (even though  $f\uparrow$  will be undefined).

Since the inner loop of *input\_ln* is part of T<sub>E</sub>X's "inner loop"—each character of input comes in at this place—it is wise to reduce system overhead by making use of special routines that read in an entire array of characters at once, if such routines are available. The following code uses standard Pascal to illustrate what needs to be done, but finer tuning is often possible at well-developed Pascal sites.

We define *input\_ln* in C, for efficiency. Nevertheless we quote the module 'Report overflow of the input buffer, and abort' here in order to make WEAVE happy, since part of that module is needed by e-TeX.

 $\mathbb{Q}\{\langle \text{Report overflow of the input buffer, and abort } 35* \rangle \mathbb{Q}\}$ 

32.\* The user's terminal acts essentially like other files of text, except that it is used both for input and for output. When the terminal is considered an input file, the file variable is called  $term\_in$ , and when it is considered an output file the file variable is  $term\_out$ .

```
define term_out \equiv stdout { the terminal as an output file }
\langle \text{Global variables } 13 \rangle + \equiv
  init ini_version: boolean; { are we INITEX? }

insert_src_special_every_vbox: boolean;
insert_src_special_every_display: boolean;
```

**33**\* Here is how to open the terminal files.  $t\_open\_out$  does nothing.  $t\_open\_in$ , on the other hand, does the work of "rescanning," or getting any command line arguments the user has provided. It's defined in C.

**define**  $t\_open\_out \equiv \{ \text{ output already open for text output } \}$ 

34.\* Sometimes it is necessary to synchronize the input/output mixture that happens on the user's terminal, and three system-dependent procedures are used for this purpose. The first of these, update\_terminal, is called when we want to make sure that everything we have output to the terminal so far has actually left the computer's internal buffers and been sent. The second, clear\_terminal, is called when we wish to cancel any input that the user may have typed ahead (since we are about to issue an unexpected error message). The third, wake\_up\_terminal, is supposed to revive the terminal if the user has disabled it by some instruction to the operating system. The following macros show how these operations can be specified with UNIX. update\_terminal does an fflush. clear\_terminal is redefined to do nothing, since the user should control the terminal.

```
define update\_terminal \equiv fflush(term\_out)
define clear\_terminal \equiv do\_nothing
define wake\_up\_terminal \equiv do\_nothing { cancel the user's cancellation of output }
```

35.\* We need a special routine to read the first line of TEX input from the user's terminal. This line is different because it is read before we have opened the transcript file; there is sort of a "chicken and egg" problem here. If the user types '\input paper' on the first line, or if some macro invoked by that line does such an \input, the transcript file will be named 'paper.log'; but if no \input commands are performed during the first line of terminal input, the transcript file will acquire its default name 'texput.log'. (The transcript file will not contain error messages generated by the first line before the first \input command.)

The first line is even more special if we are lucky enough to have an operating system that treats T<sub>E</sub>X differently from a run-of-the-mill Pascal object program. It's nice to let the user start running a T<sub>E</sub>X job by typing a command line like 'tex paper'; in such a case, T<sub>E</sub>X will operate as if the first line of input were 'paper', i.e., the first line will consist of the remainder of the command line, after the part that invoked T<sub>E</sub>X.

The first line is special also because it may be read before TEX has input a format file. In such cases, normal error messages cannot yet be given. The following code uses concepts that will be explained later. (If the Pascal compiler does not support non-local **goto**, the statement '**goto** final\_end' should be replaced by something that quietly terminates the program.)

Routine is implemented in C; part of module is, however, needed for e-TeX.

```
\langle \text{Report overflow of the input buffer, and abort } 35^* \rangle \equiv  begin cur\_input.loc\_field \leftarrow first; <math>cur\_input.limit\_field \leftarrow last - 1; overflow("buffer\_size", buf\_size); end
```

This code is used in sections 31\* and 1568.

37.\* The following program does the required initialization. Iff anything has been specified on the command line, then  $t\_open\_in$  will return with last > first.

```
function init_terminal: boolean; { gets the terminal input started }
  label exit;
  begin t\_open\_in;
  if last > first then
     begin loc \leftarrow first;
     while (loc < last) \land (buffer[loc] = ` \sqcup `) do incr(loc);
     if loc < last then
       begin init\_terminal \leftarrow true; goto exit;
       end;
     end;
  loop begin wake_up_terminal; write(term_out, `**`); update_terminal;
     if \neg input\_ln(term\_in, true) then { this shouldn't happen }
       begin \ write\_ln(term\_out); \ write\_ln(term\_out, `! \sqcup End \sqcup of \sqcup file \sqcup on \sqcup the \sqcup terminal . . . \sqcup why?');
        init\_terminal \leftarrow false;  return;
       end;
     loc \leftarrow first;
     while (loc < last) \land (buffer[loc] = " \sqcup ") do incr(loc);
     if loc < last then
       begin init\_terminal \leftarrow true; return; { return unless the line was all blank }
       end;
     write\_ln(term\_out, \text{`Please\_type\_the\_name\_of\_your\_input\_file.'});
     end;
exit: \mathbf{end};
```

tini

38\* String handling. Control sequence names and diagnostic messages are variable-length strings of eight-bit characters. Since Pascal does not have a well-developed string mechanism, TEX does all of its string processing by homegrown methods.

Elaborate facilities for dynamic strings are not needed, so all of the necessary operations can be handled with a simple data structure. The array  $str\_pool$  contains all of the (eight-bit) ASCII codes in all of the strings, and the array  $str\_start$  contains indices of the starting points of each string. Strings are referred to by integer numbers, so that string number s comprises the characters  $str\_pool[j]$  for  $str\_start\_macro[s] \le j < str\_start\_macro[s+1]$ . Additional integer variables  $pool\_ptr$  and  $str\_ptr$  indicate the number of entries used so far in  $str\_pool$  and  $str\_start$ , respectively; locations  $str\_pool[pool\_ptr]$  and  $str\_start\_macro[str\_ptr]$  are ready for the next string to be allocated.

String numbers 0 to 255 are reserved for strings that correspond to single ASCII characters. This is in accordance with the conventions of WEB, which converts single-character strings into the ASCII code number of the single character involved, while it converts other strings into integers and builds a string pool file. Thus, when the string constant "." appears in the program below, WEB converts it into the integer 46, which is the ASCII code for a period, while WEB will convert a string like "hello" into some integer greater than 255. String number 46 will presumably be the single character '.'; but some ASCII codes have no standard visible representation, and TEX sometimes needs to be able to print an arbitrary ASCII character, so the first 256 strings are used to specify exactly what should be printed for each of the 256 possibilities.

Elements of the  $str\_pool$  array must be ASCII codes that can actually be printed; i.e., they must have an xchr equivalent in the local character set. (This restriction applies only to preloaded strings, not to those generated dynamically by the user.)

Some Pascal compilers won't pack integers into a single byte unless the integers lie in the range -128...127. To accommodate such systems we access the string pool only via macros that can easily be redefined.

```
define si(\#) \equiv \# { convert from ASCII\_code to packed\_ASCII\_code }
  define so(\#) \equiv \# { convert from packed\_ASCII\_code to ASCII\_code }
  define str\_start\_macro(\#) \equiv str\_start[(\#) - too\_big\_char]
\langle \text{ Types in the outer block } 18 \rangle + \equiv
  pool\_pointer = integer; { for variables that point into str\_pool }
  str\_number = 0 \dots ssup\_max\_strings; { for variables that point into str\_start }
  packed\_ASCII\_code = 0..biqgest\_char; { elements of str\_pool array }
39* \langle Global variables 13 \rangle + \equiv
str\_pool: \uparrow packed\_ASCII\_code; \{ the characters \}
str\_start: \uparrow pool\_pointer;  { the starting pointers }
pool_ptr: pool_pointer; { first unused position in str_pool }
str_ptr: str_number; { number of the current string being created }
init_pool_ptr: pool_pointer; { the starting value of pool_ptr }
init_str_ptr: str_number; { the starting value of str_ptr }
47.* The initial values of str\_pool, str\_start, pool\_ptr, and str\_ptr are computed by the INITEX program,
based in part on the information that WEB has output while processing T<sub>F</sub>X.
(Declare additional routines for string recycling 1686*)
  init function get_strings_started: boolean;
          { initializes the string pool, but returns false if something goes wrong }
  label done, exit:
  var g: str\_number; \{ garbage \}
  begin pool\_ptr \leftarrow 0; str\_ptr \leftarrow 0; str\_start[0] \leftarrow 0; \langle Make the first 256 strings 48 \rangle;
  Read the other strings from the TEX.POOL file and return true, or give an error message and return
       false 51*;
exit: end;
```

 $\S49$  X<sub>H</sub>T<sub>E</sub>X PART 4: STRING HANDLING 15

49.\* The first 128 strings will contain 95 standard ASCII characters, and the other 33 characters will be printed in three-symbol form like '^A' unless a system-dependent change is made here. Installations that have an extended character set, where for example  $xchr['32] = '\neq'$ , would like string '32 to be printed as the single character '32 instead of the three characters '136, '136, '132 (^2). On the other hand, even people with an extended character set will want to represent string '15 by ^M, since '15 is carriage\_return; the idea is to produce visible strings instead of tabs or line-feeds or carriage-returns or bell-rings or characters that are treated anomalously in text files.

Unprintable characters of codes 128–255 are, similarly, rendered ^^80-^^ff.

The boolean expression defined here should be true unless TeX internal code number k corresponds to a non-troublesome visible symbol in the local character set. An appropriate formula for the extended character set recommended in  $The\ TeXbook$  would, for example, be ' $k \in [0, 10 ... 12, 14, 15, 33, 177 ... 377]$ '. If character k cannot be printed, and k < 200, then character k + 100 or k - 100 must be printable; moreover, ASCII codes [41 ... 46, 60 ... 71, 136, 141 ... 146, 160 ... 171] must be printable. Thus, at least 80 printable characters are needed.

**53**\* Empty module

54.\* On-line and off-line printing. Messages that are sent to a user's terminal and to the transcriptlog file are produced by several 'print' procedures. These procedures will direct their output to a variety of places, based on the setting of the global variable selector, which has the following possible values:

term\_and\_log, the normal setting, prints on the terminal and on the transcript file.

log\_only, prints only on the transcript file.

term\_only, prints only on the terminal.

no\_print, doesn't print at all. This is used only in rare cases before the transcript file is open.

pseudo, puts output into a cyclic buffer that is used by the show\_context routine; when we get to that routine we shall discuss the reasoning behind this curious mode.

new\_string, appends the output to the current string in the string pool.

0 to 15, prints on one of the sixteen files for \write output.

The symbolic names 'term\_and\_log', etc., have been assigned numeric codes that satisfy the convenient relations  $no\_print + 1 = term\_only$ ,  $no\_print + 2 = log\_only$ ,  $term\_only + 2 = log\_only + 1 = term\_and\_log$ .

Three additional global variables, tally and term\_offset and file\_offset, record the number of characters that have been printed since they were most recently cleared to zero. We use tally to record the length of (possibly very long) stretches of printing; term\_offset and file\_offset, on the other hand, keep track of how many characters have appeared so far on the current line that has been output to the terminal or to the transcript file, respectively.

```
define no\_print = 16 { selector setting that makes data disappear }
  define term\_only = 17 { printing is destined for the terminal only }
  define log\_only = 18 { printing is destined for the transcript file only }
  define term\_and\_log = 19 { normal selector setting }
  define pseudo = 20 { special selector setting for show\_context }
  define new\_string = 21 { printing is deflected to the string pool }
  define max\_selector = 21 { highest selector setting }
\langle \text{Global variables } 13 \rangle + \equiv
log_file: alpha_file; { transcript of T<sub>E</sub>X session }
selector: 0.. max_selector; { where to print a message }
dig: array [0...22] of 0...15; {digits in a number being output}
tally: integer; { the number of characters recently printed }
term_offset: 0 .. max_print_line; { the number of characters on the current terminal line }
file_offset: 0 .. max_print_line; { the number of characters on the current file line }
trick\_buf: array [0... ssup\_error\_line] of ASCII\_code; { circular buffer for pseudoprinting }
trick_count: integer; { threshold for pseudoprinting, explained later }
first_count: integer; { another variable for pseudoprinting }
```

65.\* Here is the very first thing that TFX prints: a headline that identifies the version number and format package. The term\_offset variable is temporarily incorrect, but the discrepancy is not serious since we assume that this part of the program is system dependent.

```
\langle Initialize the output routines 55\rangle + \equiv
  if src\_specials\_p \lor file\_line\_error\_style\_p \lor parse\_first\_line\_p then wterm(banner\_k)
  else wterm(banner);
  wterm(version\_string);
  if format\_ident = 0 then wterm\_ln(`\_(preloaded\_format=`, dump\_name, `)`)
  else begin slow_print(format_ident); print_ln;
    end:
  if shellenabledp then
    begin wterm(`_{\sqcup}`);
    if restrictedshell then
       begin wterm('restricted□');
       end;
    wterm_ln('\write18_enabled.');
    end;
  if src_specials_p then
    begin wterm\_ln(` \_Source\_specials\_enabled.`)
    end:
  if translate_filename then
    begin wterm(´u(WARNING: utranslate-fileu"´); fputs(translate_filename, stdout);
    wterm_ln('"_ignored)');
    end;
  update_terminal;
66* The procedure print_nl is like print, but it makes sure that the string appears at the beginning of a
new line.
\langle \text{Basic printing procedures } 57 \rangle + \equiv
procedure print_n l(s: str_n umber); { prints string s at beginning of line }
  begin if (selector < no\_print) \lor ((term\_offset > 0) \land (odd(selector))) \lor
         ((file\_offset > 0) \land (selector \ge log\_only)) then print\_ln;
  print(s);
  end;
```

75.\* Here is a procedure that asks the user to type a line of input, assuming that the selector setting is either  $term\_only$  or  $term\_and\_log$ . The input is placed into locations first through last-1 of the buffer array, and echoed on the transcript file if appropriate.

This procedure is never called when  $interaction < scroll\_mode$ .

```
define prompt_input(\#) \equiv
             begin wake_up_terminal; print(#); term_input;
             end { prints a string and gets a line of input }
procedure term_input; { gets a line from the terminal }
  \mathbf{var} \ k: \ 0 \dots buf\_size; \ \{ \text{ index into } buffer \}
  begin update_terminal; { now the user sees the prompt for sure }
  if \neg input\_ln(term\_in, true) then
     begin limit \leftarrow 0; fatal\_error("End_{\sqcup}of_{\sqcup}file_{\sqcup}on_{\sqcup}the_{\sqcup}terminal!");
     end:
  term\_offset \leftarrow 0; \quad \{ \text{ the user's line ended with } \langle \text{return} \rangle \}
  decr(selector); { prepare to echo the input }
  if last \neq first then
     for k \leftarrow first to last - 1 do print(buffer[k]);
  print_ln; incr(selector); { restore previous status }
  end;
```

```
The global variable interaction has four settings, representing increasing amounts of user interaction:
  define batch\_mode = 0 { omits all stops and omits terminal output }
  define nonstop\_mode = 1 { omits all stops }
  define scroll\_mode = 2 { omits error stops }
  define error\_stop\_mode = 3 { stops at every opportunity to interact }
  define unspecified\_mode = 4 { extra value for command-line switch }
  define print_err(\#) \equiv
           begin if interaction = error_stop_mode then wake_up_terminal;
           if file_line_error_style_p then print_file_line
            else print_nl("!_{\square}");
            print(#);
            end
\langle \text{Global variables } 13 \rangle + \equiv
interaction: batch_mode .. error_stop_mode; { current level of interaction }
interaction_option: batch_mode .. unspecified_mode; { set from command line }
78* (Set initial values of key variables 23^*) +\equiv
  if interaction\_option = unspecified\_mode then interaction \leftarrow error\_stop\_mode
  else interaction \leftarrow interaction\_option;
```

80.\* A global variable deletions\_allowed is set false if the get\_next routine is active when error is called; this ensures that *qet\_next* and related routines like *qet\_token* will never be called recursively. A similar interlock is provided by set\_box\_allowed.

The global variable history records the worst level of error that has been detected. It has five possible values: spotless, warning\_issued, error\_message\_issued, fatal\_error\_stop, and output\_failure.

Another global variable, error\_count, is increased by one when an error occurs without an interactive dialog, and it is reset to zero at the end of every paragraph. If error\_count reaches 100, T<sub>F</sub>X decides that there is no point in continuing further.

```
define spotless = 0  { history value when nothing has been amiss yet }
  define warning\_issued = 1 { history value when begin\_diagnostic has been called }
  define error\_message\_issued = 2 { history value when error has been called }
  define fatal\_error\_stop = 3 { history value when termination was premature }
  define output\_failure = 4 { history value when output driver returned an error }
\langle \text{Global variables } 13 \rangle + \equiv
deletions_allowed: boolean; { is it safe for error to call get_token? }
set_box_allowed: boolean; { is it safe to do a \setbox assignment? }
history: spotless .. output_failure; { has the source input been clean so far? }
error\_count: -1 ... 100; { the number of scrolled errors since the last paragraph ended }
```

85.\* The *jump\_out* procedure just cuts across all active procedure levels. The body of *jump\_out* simply calls '*close\_files\_and\_terminate*;' followed by a call on some system procedure that quietly terminates the program.

```
format noreturn \equiv procedure
  define do\_final\_end \equiv
            begin update\_terminal; ready\_already \leftarrow 0;
            if (history \neq spotless) \land (history \neq warning\_issued) then uexit(1)
            else uexit(0);
            end
\langle Error handling procedures 82 \rangle + \equiv
noreturn procedure jump_out;
     begin close_files_and_terminate; do_final_end;
     end:
86.* Here now is the general error routine.
\langle Error handling procedures 82 \rangle + \equiv
procedure error; { completes the job of error reporting }
  label continue, exit;
  var c: ASCII_code; { what the user types }
     s1, s2, s3, s4: integer; { used to save global variables when deleting tokens }
  begin if history < error\_message\_issued then history \leftarrow error\_message\_issued;
  print_char("."); show_context;
  if (halt_on_error_p) then
               { If close_files_and_terminate generates an error, we'll end up back here; just give up in that
     begin
          case. If files are truncated, too bad.
     if (halting_on_error_p) then do_final_end; { quit immediately }

    help2("One_of_your_faux_pas_seems_to_have_wounded_me_deeply...") 
    ("in_fact,_I´m_barely_conscious._Please_fix_it_and_try_again."); 
    end; 
succumb; 
end;</pre>
```

108.\* Physical sizes that a T<sub>E</sub>X user specifies for portions of documents are represented internally as scaled points. Thus, if we define an 'sp' (scaled point) as a unit equal to  $2^{-16}$  printer's points, every dimension inside of T<sub>E</sub>X is an integer number of sp. There are exactly 4,736,286.72 sp per inch. Users are not allowed to specify dimensions larger than  $2^{30} - 1$  sp, which is a distance of about 18.892 feet (5.7583 meters); two such quantities can be added without overflow on a 32-bit computer.

The present implementation of T<sub>E</sub>X does not check for overflow when dimensions are added or subtracted. This could be done by inserting a few dozen tests of the form 'if  $x \ge '100000000000$  then  $report\_overflow$ ', but the chance of overflow is so remote that such tests do not seem worthwhile.

TEX needs to do only a few arithmetic operations on scaled quantities, other than addition and subtraction, and the following subroutines do most of the work. A single computation might use several subroutine calls, and it is desirable to avoid producing multiple error messages in case of arithmetic overflow; so the routines set the global variable arith\_error to true instead of reporting errors directly to the user. Another global variable, remainder, holds the remainder after a division.

```
define remainder \equiv tex\_remainder

\langle Global \ variables \ 13 \rangle + \equiv

arith\_error: boolean; \{ has arithmetic overflow occurred recently? \}

remainder: scaled; \{ amount subtracted to get an exact division \}
```

113.\* When TEX "packages" a list into a box, it needs to calculate the proportionality ratio by which the glue inside the box should stretch or shrink. This calculation does not affect TEX's decision making, so the precise details of rounding, etc., in the glue calculation are not of critical importance for the consistency of results on different computers.

We shall use the type *glue\_ratio* for such proportionality ratios. A glue ratio should take the same amount of memory as an *integer* (usually 32 bits) if it is to blend smoothly with TEX's other data structures. Thus *glue\_ratio* should be equivalent to *short\_real* in some implementations of Pascal. Alternatively, it is possible to deal with glue ratios using nothing but fixed-point arithmetic; see *TUGboat* 3,1 (March 1982), 10–27. (But the routines cited there must be modified to allow negative glue ratios.)

```
define set\_glue\_ratio\_zero(\#) \equiv \# \leftarrow 0.0 { store the representation of zero ratio } define set\_glue\_ratio\_one(\#) \equiv \# \leftarrow 1.0 { store the representation of unit ratio } define float(\#) \equiv \# { convert from glue\_ratio to type real } define unfloat(\#) \equiv \# { convert from real to type glue\_ratio } define float\_constant(\#) \equiv \#.0 { convert integer constant to real } \langle Types in the outer block 18 \rangle +\equiv
```

132\* Packed data. In order to make efficient use of storage space, TEX bases its major data structures on a *memory\_word*, which contains either a (signed) integer, possibly scaled, or a (signed) *glue\_ratio*, or a small number of fields that are one half or one quarter of the size used for storing integers.

If x is a variable of type  $memory\_word$ , it contains up to four fields that can be referred to as follows:

```
x.int \qquad \text{(an integer)}
x.sc \qquad \text{(a scaled integer)}
x.gr \qquad \text{(a glue\_ratio)}
x.hh.lh, x.hh.rh \qquad \text{(two halfword fields)}
x.hh.b0, x.hh.b1, x.hh.rh \qquad \text{(two quarterword fields, one halfword field)}
x.qqqq.b0, x.qqqq.b1, x.qqqq.b2, x.qqqq.b3 \qquad \text{(four quarterword fields)}
```

This is somewhat cumbersome to write, and not very readable either, but macros will be used to make the notation shorter and more transparent. The Pascal code below gives a formal definition of *memory\_word* and its subsidiary types, using packed variant records. TeX makes no assumptions about the relative positions of the fields within a word.

Since we are assuming 32-bit integers, a halfword must contain at least 16 bits, and a quarterword must contain at least 8 bits. But it doesn't hurt to have more bits; for example, with enough 36-bit words you might be able to have *mem\_max* as large as 262142, which is eight times as much memory as anybody had during the first four years of TeX's existence.

N.B.: Valuable memory space will be dreadfully wasted unless TeX is compiled by a Pascal that packs all of the *memory\_word* variants into the space of a single integer. This means, for example, that *glue\_ratio* words should be *short\_real* instead of *real* on some computers. Some Pascal compilers will pack an integer whose subrange is '0 .. 255' into an eight-bit field, but others insist on allocating space for an additional sign bit; on such systems you can get 256 values into a quarterword only if the subrange is '-128 .. 127'.

The present implementation tries to accommodate as many variations as possible, so it makes few assumptions. If integers having the subrange 'min\_quarterword .. max\_quarterword' can be packed into a quarterword, and if integers having the subrange 'min\_halfword .. max\_halfword' can be packed into a halfword, everything should work satisfactorily.

It is usually most efficient to have  $min\_quarterword = min\_halfword = 0$ , so one should try to achieve this unless it causes a severe problem. The values defined here are recommended for most 32-bit computers.

```
 \begin{array}{ll} \textbf{define} \  \, min\_quarterword = 0 \quad \{ \text{ smallest allowable value in a } \, quarterword \, \} \\ \textbf{define} \  \, max\_quarterword = \text{``FFFF} \quad \{ \text{ largest allowable value in a } \, halfword \, \} \\ \textbf{define} \  \, min\_halfword \equiv \text{``SFFFFFF} \quad \{ \text{ largest allowable value in a } \, halfword \, \} \\ \textbf{define} \  \, max\_halfword \equiv \text{``3FFFFFFF} \quad \{ \text{ largest allowable value in a } \, halfword \, \} \\ \end{array}
```

133.\* Here are the inequalities that the quarterword and halfword values must satisfy (or rather, the inequalities that they mustn't satisfy):

```
⟨ Check the "constant" values for consistency 14⟩ +≡
    init if (mem\_min \neq mem\_bot) \lor (mem\_max \neq mem\_top) then bad \leftarrow 10;
    tini
    if (mem\_min > mem\_bot) \lor (mem\_max < mem\_top) then bad \leftarrow 10;
    if (min\_quarterword > 0) \lor (max\_quarterword < "7FFF) then bad \leftarrow 11;
    if (min\_halfword > 0) \lor (max\_halfword < "3FFFFFFF) then bad \leftarrow 12;
    if (min\_quarterword < min\_halfword) \lor (max\_quarterword > max\_halfword) then bad \leftarrow 13;
    if (mem\_bot - sup\_main\_memory < min\_halfword) \lor (mem\_top + sup\_main\_memory \ge max\_halfword)
        then bad \leftarrow 14;
    if (max\_font\_max < min\_halfword) \lor (max\_font\_max > max\_halfword) then bad \leftarrow 15;
    if (save\_size > max\_halfword) \lor (max\_strings > max\_halfword) then bad \leftarrow 17;
    if buf\_size > max\_halfword then bad \leftarrow 18;
    if max\_quarterword - min\_quarterword < "FFFF then <math>bad \leftarrow 19;
```

 $\S134$  X $_{
m TEX}$  Part 8: Packed data 25

134.\* The operation of adding or subtracting  $min\_quarterword$  occurs quite frequently in  $T_EX$ , so it is convenient to abbreviate this operation by using the macros qi and qo for input and output to and from quarterword format.

The inner loop of  $T_EX$  will run faster with respect to compilers that don't optimize expressions like 'x + 0' and 'x - 0', if these macros are simplified in the obvious way when  $min\_quarterword = 0$ . So they have been simplified here in the obvious way.

The WEB source for TEX defines  $hi(\#) \equiv \# + min\_halfword$  which can be simplified when  $min\_halfword = 0$ . The Web2C implementation of TEX can use  $hi(\#) \equiv \#$  together with  $min\_halfword < 0$  as long as  $max\_halfword$  is sufficiently large.

```
define qi(\#) \equiv \#
                       { to put an eight_bits item into a quarterword }
  define qo(\#) \equiv \#
                       { to take an eight_bits item from a quarterword }
  define hi(\#) \equiv \#
                       { to put a sixteen-bit item into a halfword }
  define ho(\#) \equiv \#
                       { to take a sixteen-bit item from a halfword }
135*
       The reader should study the following definitions closely:
  define sc \equiv int \quad \{ scaled \text{ data is equivalent to } integer \}
\langle \text{Types in the outer block } 18 \rangle + \equiv
  quarterword = min\_quarterword ... max\_quarterword; halfword = min\_halfword ... max\_halfword;
  two\_choices = 1 \dots 2; { used when there are two variants in a record }
  four\_choices = 1...4; { used when there are four variants in a record }
   #include_"texmfmem.h"; |word\_file = gzFile;
```

138\* The mem array is divided into two regions that are allocated separately, but the dividing line between these two regions is not fixed; they grow together until finding their "natural" size in a particular job. Locations less than or equal to lo\_mem\_max are used for storing variable-length records consisting of two or more words each. This region is maintained using an algorithm similar to the one described in exercise 2.5–19 of The Art of Computer Programming. However, no size field appears in the allocated nodes; the program is responsible for knowing the relevant size when a node is freed. Locations greater than or equal to hi\_mem\_min are used for storing one-word records; a conventional AVAIL stack is used for allocation in this region.

Locations of *mem* between *mem\_bot* and *mem\_top* may be dumped as part of preloaded format files, by the INITEX preprocessor. Production versions of TeX may extend the memory at both ends in order to provide more space; locations between *mem\_min* and *mem\_bot* are always used for variable-size nodes, and locations between *mem\_top* and *mem\_max* are always used for single-word nodes.

The key pointers that govern mem allocation have a prescribed order:

```
null \le mem\_min \le mem\_bot < lo\_mem\_max < hi\_mem\_min < mem\_top \le mem\_end \le mem\_max.
```

Empirical tests show that the present implementation of TEX tends to spend about 9% of its running time allocating nodes, and about 6% deallocating them after their use.

```
\langle Global variables 13\rangle += yzmem: \uparrow memory\_word; { the big dynamic storage area } zmem: \uparrow memory\_word; { the big dynamic storage area } zmem\_max: z
```

147\* A call to *get\_node* with argument s returns a pointer to a new node of size s, which must be 2 or more. The *link* field of the first word of this new node is set to null. An overflow stop occurs if no suitable space exists.

If  $get\_node$  is called with  $s = 2^{30}$ , it simply merges adjacent free areas and returns the value  $max\_halfword$ .

```
function get\_node(s:integer): pointer; { variable-size node allocation }
  label found, exit, restart;
  var p: pointer; { the node currently under inspection }
     q: pointer; { the node physically after node p }
     r: integer; { the newly allocated node, or a candidate for this honor }
     t: integer; { temporary register }
  begin restart: p \leftarrow rover; { start at some free node in the ring }
  repeat \langle Try to allocate within node p and its physical successors, and goto found if allocation was
          possible 149;
     p \leftarrow rlink(p); { move to the next node in the ring }
  until p = rover; {repeat until the whole list has been traversed}
  if s = 1000000000000 then
     begin get\_node \leftarrow max\_halfword; return;
     end:
  if lo\_mem\_max + 2 < hi\_mem\_min then
     if lo\_mem\_max + 2 \le mem\_bot + max\_halfword then
       ⟨ Grow more variable-size memory and goto restart 148⟩;
  overflow("main\_memory\_size", mem\_max + 1 - mem\_min);  { sorry, nothing satisfactory is left }
found: link(r) \leftarrow null; { this node is now nonempty }
  stat var\_used \leftarrow var\_used + s; { maintain usage statistics }
  \langle \text{Initialize bigger nodes with } SyncT_{FX} \text{ information } 1715^* \rangle;
  get\_node \leftarrow r;
exit: \mathbf{end};
```

157.\* An hlist\_node stands for a box that was made from a horizontal list. Each hlist\_node is seven words long, and contains the following fields (in addition to the mandatory type and link, which we shall not mention explicitly when discussing the other node types): The height and width and depth are scaled integers denoting the dimensions of the box. There is also a shift\_amount field, a scaled integer indicating how much this box should be lowered (if it appears in a horizontal list), or how much it should be moved to the right (if it appears in a vertical list). There is a list\_ptr field, which points to the beginning of the list from which this box was fabricated; if list\_ptr is null, the box is empty. Finally, there are three fields that represent the setting of the glue: glue\_set(p) is a word of type glue\_ratio that represents the proportionality constant for glue setting; glue\_sign(p) is stretching or shrinking or normal depending on whether or not the glue should stretch or shrink or remain rigid; and glue\_order(p) specifies the order of infinity to which glue setting applies (normal, fil, fill, or filll). The subtype field is not used in TeX. In  $\varepsilon$ -TeX the subtype field records the box direction mode box\_lr.

```
define synctex\_field\_size = 1 { Declare the SyncT_FX field size to store the SyncT_FX information: we
            will put file tag and line into lh and rh fields of one word }
define sync\_tag(\#) \equiv mem[\#-synctex\_field\_size].hh.lh { The tag subfield }
define sync\_line(\#) \equiv mem[\#-synctex\_field\_size].hh.rh { The line subfield }
define hlist\_node = 0  { type of hlist nodes }
define box\_node\_size = 7 + synctex\_field\_size { number of words to allocate for a box node }
define width\_offset = 1 { position of width field in a box node }
define depth\_offset = 2 { position of depth field in a box node }
define height\_offset = 3 { position of height field in a box node }
define width(\#) \equiv mem[\# + width\_offset].sc { width of the box, in sp }
define depth(\#) \equiv mem[\# + depth\_offset].sc { depth of the box, in sp }
define height(\#) \equiv mem[\# + height\_offset].sc { height of the box, in sp }
define shift\_amount(\#) \equiv mem[\# + 4].sc { repositioning distance, in sp }
define list\_offset = 5 { position of list\_ptr field in a box node }
define list\_ptr(\#) \equiv link(\# + list\_offset) { beginning of the list inside the box }
define glue\_order(\#) \equiv subtype(\# + list\_offset) { applicable order of infinity }
define glue\_sign(\#) \equiv type(\# + list\_offset) { stretching or shrinking }
define normal = 0 { the most common case when several cases are named }
define stretching = 1 { glue setting applies to the stretch components }
define shrinking = 2 { glue setting applies to the shrink components }
define glue\_offset = 6 { position of glue\_set in a box node }
define glue\_set(\#) \equiv mem[\# + glue\_offset].gr { a word of type glue\_ratio for glue setting }
```

160\* A rule\_node stands for a solid black rectangle; it has width, depth, and height fields just as in an hlist\_node. However, if any of these dimensions is  $-2^{30}$ , the actual value will be determined by running the rule up to the boundary of the innermost enclosing box. This is called a "running dimension." The width is never running in an hlist; the height and depth are never running in a vlist.

163\* A mark\_node has a mark\_ptr field that points to the reference count of a token list that contains the user's \mark text. In addition there is a mark\_class field that contains the mark class.

```
 \begin{array}{ll} \textbf{define} & \textit{mark\_node} = 4 & \{\textit{type} \text{ of a mark node}\} \\ \textbf{define} & \textit{small\_node\_size} = 2 & \{\text{number of words to allocate for most node types}\} \\ \textbf{define} & \textit{medium\_node\_size} = \textit{small\_node\_size} + \textit{synctex\_field\_size} & \{\text{number of words to allocate for synchronized node types like math, kern, glue and penalty nodes}\} \\ \textbf{define} & \textit{mark\_ptr}(\#) \equiv link(\#+1) & \{\text{head of the token list for a mark}\} \\ \textbf{define} & \textit{mark\_class}(\#) \equiv info(\#+1) & \{\text{the mark class}\} \\ \end{array}
```

166\* The new\_ligature function creates a ligature node having given contents of the font, character, and lig\_ptr fields. We also have a new\_lig\_item function, which returns a two-word node having a given character field. Such nodes are used for temporary processing as ligatures are being created.

```
function new\_ligature(f:internal\_font\_number; c:quarterword; q:pointer): pointer;
var p:pointer; { the new node }
begin p \leftarrow get\_node(small\_node\_size); type(p) \leftarrow ligature\_node; font(lig\_char(p)) \leftarrow f;
character(lig\_char(p)) \leftarrow c; lig\_ptr(p) \leftarrow q; subtype(p) \leftarrow 0; new\_ligature \leftarrow p;
end;
function new\_lig\_item(c:quarterword): pointer;
var p:pointer; { the new node }
begin p \leftarrow get\_node(small\_node\_size); character(p) \leftarrow c; lig\_ptr(p) \leftarrow null; new\_lig\_item \leftarrow p;
end;
```

171.\* A math\_node, which occurs only in horizontal lists, appears before and after mathematical formulas. The subtype field is before before the formula and after after it. There is a width field, which represents the amount of surrounding space inserted by \mathsurround.

In addition a  $math\_node$  with subtype > after and width = 0 will be (ab)used to record a regular  $math\_node$  reinserted after being discarded at a line break or one of the text direction primitives ( \beginL, \endL, \beginR, and \endR).

```
define math\_node = 9 { type of a math node }
  define before = 0 { subtype for math node that introduces a formula }
  define after = 1 { subtype for math node that winds up a formula }
  define M_{-}code = 2
  define begin\_M\_code = M\_code + before  { subtype for \beginM node }
  define end_{-}M_{-}code = M_{-}code + after  { subtype for \endM node }
  define L_{-}code = 4
  define begin\_L\_code = L\_code + begin\_M\_code { subtype for \beginL node }
  define end_{-}L_{-}code = L_{-}code + end_{-}M_{-}code  { subtype for \endL node }
  define R-code = L-code + L-code
  define begin_R - code = R - code + begin_M - code  { subtype for \begin_R node }
  define end_R\_code = R\_code + end_M\_code { subtype for \endR node }
  define end_{-}LR(\#) \equiv odd(subtype(\#))
  define end_{-}LR_{-}type(\#) \equiv (L_{-}code * (subtype(\#) \operatorname{\mathbf{div}} L_{-}code) + end_{-}M_{-}code)
  define begin\_LR\_type(\#) \equiv (\# - after + before)
function new\_math(w : scaled; s : small\_number): pointer;
  var p: pointer; { the new node }
  begin p \leftarrow get\_node(medium\_node\_size); type(p) \leftarrow math\_node; subtype(p) \leftarrow s; width(p) \leftarrow w;
  new\_math \leftarrow p;
  end;
```

176\* And here's a function that creates a glue node for a given parameter identified by its code number; for example,  $new\_param\_glue(line\_skip\_code)$  returns a pointer to a glue node for the current \lineskip.

```
function new\_param\_glue(n:small\_number): pointer;
var p: pointer; { the new node }
q: pointer; { the glue specification }
begin p \leftarrow get\_node(medium\_node\_size); type(p) \leftarrow glue\_node; subtype(p) \leftarrow n+1; leader\_ptr(p) \leftarrow null;
q \leftarrow \langle \text{Current } mem \text{ equivalent of glue parameter number } n \text{ 250} \rangle; glue\_ptr(p) \leftarrow q;
incr(glue\_ref\_count(q)); new\_param\_glue \leftarrow p;
end;
```

177\* Glue nodes that are more or less anonymous are created by *new\_glue*, whose argument points to a glue specification.

```
function new\_glue(q:pointer): pointer;

var\ p: pointer; { the new node }

begin\ p \leftarrow get\_node(medium\_node\_size); type(p) \leftarrow glue\_node; subtype(p) \leftarrow normal;

leader\_ptr(p) \leftarrow null; glue\_ptr(p) \leftarrow q; incr(glue\_ref\_count(q)); new\_glue \leftarrow p;

end;
```

**180**\* The *new\_kern* function creates a kern node having a given width.

```
function new\_kern(w:scaled): pointer;

var p: pointer; { the new node }

begin p \leftarrow get\_node(medium\_node\_size); type(p) \leftarrow kern\_node; subtype(p) \leftarrow normal; width(p) \leftarrow w;

new\_kern \leftarrow p;

end;
```

183.\* Anyone who has been reading the last few sections of the program will be able to guess what comes next.

```
function new\_penalty(m:integer): pointer;

var p: pointer; { the new node }

begin p \leftarrow get\_node(medium\_node\_size); type(p) \leftarrow penalty\_node; subtype(p) \leftarrow 0;

{ the subtype is not used }

penalty(p) \leftarrow m; new\_penalty \leftarrow p;

end;
```

30 Part 11: Memory Layout  $x_{\overline{a}}$ Tex §187

190\* If TeX is extended improperly, the *mem* array might get screwed up. For example, some pointers might be wrong, or some "dead" nodes might not have been freed when the last reference to them disappeared. Procedures *check\_mem* and *search\_mem* are available to help diagnose such problems. These procedures make use of two arrays called *free* and *was\_free* that are present only if TeX's debugging routines have been included. (You may want to decrease the size of *mem* while you are debugging.)

```
define free = free_arr

(Global variables 13) +=

{ The debug memory arrays have not been mallocated yet.}

debug free: packed array [0..9] of boolean; { free cells }

was_free: packed array [0..9] of boolean; { previously free cells }

was_mem_end, was_lo_max, was_hi_min: pointer; { previous mem_end, lo_mem_max, and hi_mem_min }

panicking: boolean; { do we want to check memory constantly? }

gubed
```

end;

end;

else  $print\_scaled(d)$ ;

PART 12: DISPLAYING BOXES  $X_{\overline{3}}T_{\overline{E}}X$ 200.\* Boxes, rules, inserts, whatsits, marks, and things in general that are sort of "complicated" are indicated only by printing '[]'. **procedure**  $short\_display(p:integer);$  { prints highlights of list p } **var** n: integer; { for replacement counts } begin while  $p > mem_{-}min$  do begin if  $is\_char\_node(p)$  then begin if  $p \leq mem\_end$  then **begin if**  $font(p) \neq font\_in\_short\_display$  **then begin if**  $(font(p) > font\_max)$  **then**  $print\_char("*")$ **else**  $\langle \text{Print the font identifier for } font(p) | 297 \rangle$ ;  $print\_char("_{\sqcup}"); font\_in\_short\_display \leftarrow font(p);$  $print\_ASCII(qo(character(p)));$ end; end else  $\langle Print a \text{ short indication of the contents of node } p 201 \rangle$ ;  $p \leftarrow link(p)$ ; end; end; 202\* The show\_node\_list routine requires some auxiliary subroutines: one to print a font-and-character combination, one to print a token list without its reference count, and one to print a rule dimension. **procedure**  $print\_font\_and\_char(p:integer);$  { prints  $char\_node$  data } **begin if**  $p > mem\_end$  **then**  $print\_esc("CLOBBERED.")$ else begin if  $(font(p) > font\_max)$  then  $print\_char("*")$ else  $\langle Print \text{ the font identifier for } font(p) | 297 \rangle$ ;  $print\_char(""); print\_ASCII(qo(character(p)));$ end: end; **procedure**  $print\_mark(p:integer);$  { prints token list data in braces } **begin** print\_char("{"); if  $(p < hi\_mem\_min) \lor (p > mem\_end)$  then  $print\_esc("CLOBBERED.")$ else  $show\_token\_list(link(p), null, max\_print\_line - 10);$ print\_char("\}");

**procedure**  $print\_rule\_dimen(d : scaled);$  { prints dimension in rule node }

**begin if** *is\_running*(*d*) **then** *print\_char*("\*")

212.\* The code will have to change in this place if *glue\_ratio* is a structured type instead of an ordinary *real*. Note that this routine should avoid arithmetic errors even if the *glue\_set* field holds an arbitrary random value. The following code assumes that a properly formed nonzero *real* number has absolute value 2<sup>20</sup> or more when it is regarded as an integer; this precaution was adequate to prevent floating point underflow on the author's computer.

```
⟨ Display the value of glue\_set(p) 212*⟩ ≡ g \leftarrow float(glue\_set(p)); if (g \neq float\_constant(0)) \land (glue\_sign(p) \neq normal) then begin print(", _{\square}glue\_set_{\square}"); if glue\_sign(p) = shrinking then print("-_{\square}"); { The Unix pc folks removed this restriction with a remark that invalid bit patterns were vanishingly improbable, so we follow their example without really understanding it. if abs(mem[p + glue\_offset].int) < '4000000 then print("?.?") else } if fabs(g) > float\_constant(20000) then begin if g > float\_constant(0) then print\_char(">") else print("<_{\square}"); print\_glue(20000 * unity, glue\_order(p), 0); end else print\_glue(round(unity * g), glue\_order(p), 0); end
```

This code is used in section 210.

228\* Now we are ready to delete any node list, recursively. In practice, the nodes deleted are usually charnodes (about 2/3 of the time), and they are glue nodes in about half of the remaining cases.

```
procedure flush\_node\_list(p:pointer); { erase list of nodes starting at p }
  label done; { go here when node p has been freed }
  var q: pointer; { successor to node p }
  begin while p \neq null do
    begin q \leftarrow link(p);
    if is\_char\_node(p) then free\_avail(p)
    else begin case type(p) of
       hlist_node, vlist_node, unset_node: begin flush_node_list(list_ptr(p)); free_node(p, box_node_size);

define max\_command = 103 { the largest command code seen at big\_switch }
```

237.\* The semantic nest. TEX is typically in the midst of building many lists at once. For example, when a math formula is being processed, TEX is in math mode and working on an mlist; this formula has temporarily interrupted TEX from being in horizontal mode and building the hlist of a paragraph; and this paragraph has temporarily interrupted TEX from being in vertical mode and building the vlist for the next page of a document. Similarly, when a \vbox occurs inside of an \hbox, TEX is temporarily interrupted from working in restricted horizontal mode, and it enters internal vertical mode. The "semantic nest" is a stack that keeps track of what lists and modes are currently suspended.

At each level of processing we are in one of six modes:

```
vmode stands for vertical mode (the page builder);
hmode stands for horizontal mode (the paragraph builder);
mmode stands for displayed formula mode;
-vmode stands for internal vertical mode (e.g., in a \vbox);
-hmode stands for restricted horizontal mode (e.g., in an \hbox);
-mmode stands for math formula mode (not displayed).
```

The mode is temporarily set to zero while processing \write texts.

Numeric values are assigned to vmode, hmode, and mmode so that TEX's "big semantic switch" can select the appropriate thing to do by computing the value  $abs(mode) + cur\_cmd$ , where mode is the current mode and  $cur\_cmd$  is the current command code.

```
define vmode = 1 { vertical mode }
  define hmode = vmode + max\_command + 1 { horizontal mode }
  define mmode = hmode + max\_command + 1 { math mode }
procedure print\_mode(m:integer); { prints the mode represented by m }
  begin if m > 0 then
    case m \operatorname{div} (max\_command + 1) \operatorname{of}
    0: print("vertical_mode");
    1: print("horizontal_mode");
    2: print("display_math_mode");
    end
  else if m = 0 then print("no\_mode")
    else case (-m) div (max\_command + 1) of
      0: print("internal_vertical_mode");
      1: print("restricted_horizontal_mode");
      2: print("math_mode");
      end:
  end;
procedure print\_in\_mode(m:integer); { prints the mode represented by m }
  begin if m > 0 then
    case m \operatorname{div} (max\_command + 1) \operatorname{of}
    0: print("'_in_vertical_mode");
    1: print("'_in_horizontal_mode");
    2: print("'uinudisplayumathumode");
  else if m = 0 then print("'_{\perp}in_{\perp}no_{\perp}mode")
    else case (-m) div (max\_command + 1) of
      0: print("'_in_internal_vertical_mode");
      1: print(" `¬in¬restricted¬horizontal¬mode");
      2: print("'_in_imath_imode");
      end;
  end;
```

```
define mode \equiv cur\_list.mode\_field { current mode }
  define head \equiv cur\_list.head\_field { header node of current list }
  define tail \equiv cur\_list.tail\_field { final node on current list }

cur_list: list_state_record; { the "top" semantic state }
shown\_mode: -mmode: \ \{most\ recent\ mode\ shown\ by\ \tracingcommands\}
```

241\* We will see later that the vertical list at the bottom semantic level is split into two parts; the "current page" runs from page\_head to page\_tail, and the "contribution list" runs from contrib\_head to tail of semantic level zero. The idea is that contributions are first formed in vertical mode, then "contributed" to the current page (during which time the page-breaking decisions are made). For now, we don't need to know any more details about the page-building process.

```

  end { there are no other cases }
This code is used in section 244.
```

246.\* The table of equivalents. Now that we have studied the data structures for TEX's semantic routines, we ought to consider the data structures used by its syntactic routines. In other words, our next concern will be the tables that TEX looks at when it is scanning what the user has written.

The biggest and most important such table is called *eqtb*. It holds the current "equivalents" of things; i.e., it explains what things mean or what their current values are, for all quantities that are subject to the nesting structure provided by T<sub>F</sub>X's grouping mechanism. There are six parts to *eqtb*:

- 1)  $eqtb[active\_base ... (hash\_base 1)]$  holds the current equivalents of single-character control sequences.
- 2)  $eqtb[hash\_base ... (glue\_base 1)]$  holds the current equivalents of multiletter control sequences.
- 3)  $eqtb[glue\_base$  ..  $(local\_base 1)]$  holds the current equivalents of glue parameters like the current baselineskip.
- 4) eqtb[local\_base .. (int\_base 1)] holds the current equivalents of local halfword quantities like the current box registers, the current "catcodes," the current font, and a pointer to the current paragraph shape. Additionally region 4 contains the table with MLTEX's character substitution definitions.
- 5)  $eqtb[int\_base ... (dimen\_base 1)]$  holds the current equivalents of fullword integer parameters like the current hyphenation penalty.
- 6) eqtb[dimen\_base .. eqtb\_size] holds the current equivalents of fullword dimension parameters like the current hsize or amount of hanging indentation.

Note that, for example, the current amount of baselineskip glue is determined by the setting of a particular location in region 3 of eqtb, while the current meaning of the control sequence '\baselineskip' (which might have been changed by \def or \let) appears in region 2.

**248**\* Many locations in *eqtb* have symbolic names. The purpose of the next paragraphs is to define these names, and to set up the initial values of the equivalents.

In the first region we have *number\_usvs* equivalents for "active characters" that act as control sequences, followed by *number\_usvs* equivalents for single-character control sequences.

Then comes region 2, which corresponds to the hash table that we will define later. The maximum address in this region is used for a dummy control sequence that is perpetually undefined. There also are several locations for control sequences that are perpetually defined (since they are used in error recovery).

```
define active\_base = 1 { beginning of region 1, for active character equivalents }
  define single\_base = active\_base + number\_usvs { equivalents of one-character control sequences }
  define null\_cs = single\_base + number\_usvs { equivalent of \csname\endcsname}
  define hash\_base = null\_cs + 1 { beginning of region 2, for the hash table }
  define frozen\_control\_sequence = hash\_base + hash\_size { for error recovery }
  define frozen_protection = frozen_control_sequence { inaccessible but definable }
  define frozen_cr = frozen_control_sequence + 1 { permanent '\cr'}
  define frozen_end_group = frozen_control_sequence + 2 { permanent '\endgroup' }
  define frozen_right = frozen_control_sequence + 3 { permanent '\right' }
  define frozen\_fi = frozen\_control\_sequence + 4 { permanent '\fi'}
  \mathbf{define} \ \mathit{frozen\_end\_template} = \mathit{frozen\_control\_sequence} + 5 \quad \{ \ \mathsf{permanent} \ `\ \mathsf{endtemplate}' \}
  define frozen\_endv = frozen\_control\_sequence + 6  { second permanent '\endtemplate' }
  define frozen\_relax = frozen\_control\_sequence + 7  { permanent '\relax'}
  define end_write = frozen_control_sequence + 8 { permanent '\endwrite' }
  define frozen_dont_expand = frozen_control_sequence + 9 { permanent '\notexpanded:'}
  define prim\_size = 2100 { maximum number of primitives }
  define frozen_special = frozen_control_sequence + 10 { permanent '\special' }
  define frozen_null_font = frozen_control_sequence + 12 + prim_size { permanent '\nullfont' }
  define frozen_primitive = frozen_control_sequence + 11 { permanent '\pdfprimitive' }
  define prim\_eqtb\_base = frozen\_primitive + 1
  define font\_id\_base = frozen\_null\_font - font\_base { begins table of 257 permanent font identifiers }
  define undefined\_control\_sequence = frozen\_null\_font + max\_font\_max + 1 { dummy location }
  define glue\_base = undefined\_control\_sequence + 1  { beginning of region 3 }
\langle Initialize table entries (done by INITEX only) 189\rangle + \equiv
  eq\_type(undefined\_control\_sequence) \leftarrow undefined\_cs; equiv(undefined\_control\_sequence) \leftarrow null;
  eq\_level(undefined\_control\_sequence) \leftarrow level\_zero;
  for k \leftarrow active\_base to eqtb\_top do eqtb[k] \leftarrow eqtb[undefined\_control\_sequence];
```

256\* Region 4 of eqtb contains the local quantities defined here. The bulk of this region is taken up by five tables that are indexed by eight-bit characters; these tables are important to both the syntactic and semantic portions of TeX. There are also a bunch of special things like font and token parameters, as well as the tables of \toks and \box registers.

```

**262\*** Region 5 of eqtb contains the integer parameters and registers defined here, as well as the  $del\_code$  table. The latter table differs from the  $cat\_code$  ...  $math\_code$  tables that precede it, since delimiter codes are fullword integers while the other kinds of codes occupy at most a halfword. This is what makes region 5 different from region 4. We will store the  $eq\_level$  information in an auxiliary array of quarterwords that will be defined later.

266.* The integer parameters should really be initialized by a macro package; the following initialization
does the minimum to keep T<sub>E</sub>X from complete failure.
\langle Initialize table entries (done by INITEX only) 189\rangle + \equiv
  for k \leftarrow int\_base to del\_code\_base - 1 do eqtb[k].int \leftarrow 0;
  char\_sub\_def\_min \leftarrow 256; char\_sub\_def\_max \leftarrow -1; {allow \charsubdef for char 0}
    \{ tracing\_char\_sub\_def \leftarrow 0 \text{ is already done } \}
  mag \leftarrow 1000; tolerance \leftarrow 10000; hang\_after \leftarrow 1; max\_dead\_cycles \leftarrow 25; escape\_char \leftarrow "\";
  end\_line\_char \leftarrow carriage\_return;
  for k \leftarrow 0 to number\_usvs - 1 do del\_code(k) \leftarrow -1;
  del\_code(".") \leftarrow 0; { this null delimiter is used in error recovery }
  show\_stream \leftarrow -1;
267.* The following procedure, which is called just before TFX initializes its input and output, establishes
the initial values of the date and time. It calls a date_and_time C macro (a.k.a. dateandtime), which calls the
C function qet_date_and_time, passing it the addresses of sys_time, etc., so they can be set by the routine.
get_date_and_time also sets up interrupt catching if that is conditionally compiled in the C code.
  We have to initialize the sys_ variables because that is what gets output on the first line of the log file.
(New in 2021.)
procedure fix_date_and_time;
  \textbf{begin} \ date\_and\_time(sys\_time, sys\_day, sys\_month, sys\_year); \ time \leftarrow sys\_time;
       { minutes since midnight }
```

 $zeqtb: \uparrow memory\_word;$ 

xeq\_level: array [int\_base .. eqtb\_size] of quarterword;

```
278* Here is a procedure that displays the contents of eqtb[n] symbolically.
(Declare the procedure called print_cmd_chr 328)
  stat procedure show_eqtb(n : pointer);
  begin if n < active\_base then print\_char("?") { this can't happen }

```

52 PART 18: THE HASH TABLE X4IEX  $\S 282$ 

**282\*** The hash table. Control sequences are stored and retrieved by means of a fairly standard hash table algorithm called the method of "coalescing lists" (cf. Algorithm 6.4C in *The Art of Computer Programming*). Once a control sequence enters the table, it is never removed, because there are complicated situations involving \gdef where the removal of a control sequence at the end of a group would be a mistake preventable only by the introduction of a complicated reference-count mechanism.

The actual sequence of letters forming a control sequence identifier is stored in the  $str\_pool$  array together with all the other strings. An auxiliary array hash consists of items with two halfword fields per word. The first of these, called next(p), points to the next identifier belonging to the same coalesced list as the identifier corresponding to p; and the other, called text(p), points to the  $str\_start$  entry for p's identifier. If position p of the hash table is empty, we have text(p) = 0; if position p is either empty or the end of a coalesced hash list, we have next(p) = 0. An auxiliary pointer variable called  $hash\_used$  is maintained in such a way that all locations  $p \ge hash\_used$  are nonempty. The global variable  $cs\_count$  tells how many multiletter control sequences have been defined, if statistics are being kept.

A global boolean variable called  $no\_new\_control\_sequence$  is set to true during the time that new hash table entries are forbidden.

```
define next(\#) \equiv hash[\#].lh
                                     { link for coalesced lists }
  define text(\#) \equiv hash[\#].rh { string number for control sequence name }
  define hash\_is\_full \equiv (hash\_used = hash\_base) { test if all positions are occupied }
  define font\_id\_text(\#) \equiv text(font\_id\_base + \#) { a frozen font identifier's name }
\langle \text{Global variables } 13 \rangle + \equiv

  stat incr(cs\_count); tats
  end
This code is used in section 286.
```

292\* Single-character control sequences do not need to be looked up in a hash table, since we can use the character code itself as a direct address. The procedure *print\_cs* prints the name of a control sequence, given a pointer to its address in *eqtb*. A space is printed after the name unless it is a single nonletter or an active character. This procedure might be invoked with invalid data, so it is "extra robust." The individual characters must be printed one at a time using *print*, since they may be unprintable.

```
\langle \text{ Basic printing procedures } 57 \rangle + \equiv
procedure print_cs(p:integer); { prints a purported control sequence }
  begin if p < hash\_base then { single character }
     if p \ge single\_base then

```

- 330\* Input stacks and states. This implementation of TeX uses two different conventions for representing sequential stacks.
- 1) If there is frequent access to the top entry, and if the stack is essentially never empty, then the top entry is kept in a global variable (even better would be a machine register), and the other entries appear in the array stack[0..(ptr-1)]. For example, the semantic stack described above is handled this way, and so is the input stack that we are about to study.
- 2) If there is infrequent top access, the entire stack contents are in the array stack[0 ... (ptr 1)]. For example, the  $save\_stack$  is treated this way, as we have seen.

The state of T<sub>E</sub>X's input mechanism appears in the input stack, whose entries are records with six fields, called *state*, *index*, *start*, *loc*, *limit*, and *name*. This stack is maintained with convention (1), so it is declared in the following way:

```
⟨Types in the outer block 18⟩ +≡
    in_state_record = record state_field, index_field: quarterword;
    start_field, loc_field, limit_field, name_field: halfword;
    synctex_tag_field: integer; { stack the tag of the current file }
    end;

331* ⟨Global variables 13⟩ +≡
    input_stack: ↑in_state_record;
    input_ptr: 0 .. stack_size; { first unused location of input_stack }
    max_in_stack: 0 .. stack_size; { largest value of input_ptr when pushing }
    cur_input: in_state_record; { the "top" input state, according to convention (1) }

332* We've already defined the special variable loc ≡ cur_input.loc_field in our discussion of basic input-output routines. The other components of cur_input are defined in the same way:
    define state ≡ cur_input.state_field { current scanner state }
    define index ≡ cur_input.index field { reference for buffer information }
```

334\* Additional information about the current line is available via the index variable, which counts how many lines of characters are present in the buffer below the current level. We have index = 0 when reading from the terminal and prompting the user for each line; then if the user types, e.g., '\input paper', we will have index = 1 while reading the file paper.tex. However, it does not follow that index is the same as the input stack pointer, since many of the levels on the input stack may come from token lists. For example, the instruction '\input paper' might occur in a token list.

The global variable  $in\_open$  is equal to the index value of the highest non-token-list level. Thus, the number of partially read lines in the buffer is  $in\_open + 1$ , and we have  $in\_open = index$  when we are not reading a token list.

If we are not currently reading from the terminal, or from an input stream, we are reading from the file variable  $input\_file[index]$ . We use the notation  $terminal\_input$  as a convenient abbreviation for name = 0, and  $cur\_file$  as an abbreviation for  $input\_file[index]$ .

The global variable *line* contains the line number in the topmost open file, for use in error messages. If we are not reading from the terminal,  $line\_stack[index]$  holds the line number for the enclosing level, so that line can be restored when the current file has been read. Line numbers should never be negative, since the negative of the current line number is used to identify the user's output routine in the  $mode\_line$  field of the semantic nest entries.

If more information about the input state is needed, it can be included in small arrays like those shown here. For example, the current page or segment number in the input file might be put into a variable page, maintained for enclosing levels in 'page\_stack: array [1 .. max\_in\_open] of integer' by analogy with line\_stack.

```
define terminal\_input \equiv (name = 0) { are we reading from the terminal?} define cur\_file \equiv input\_file[index] { the current alpha\_file variable } \langle Global variables 13 \rangle + \equiv in\_open: 0 .. max\_in\_open; { the number of lines in the buffer, less one } open\_parens: 0 .. max\_in\_open; { the number of open text files } input\_file: \uparrow unicode\_file; line: integer; { current line number in the current source file } line\_stack: \uparrow integer; source\_filename\_stack: \uparrow str\_number; full\_source\_filename\_stack: \uparrow str\_number;
```

**336**\* Here is a procedure that uses *scanner\_status* to print a warning message when a subfile has ended, and at certain other crucial times:

```
⟨ Declare the procedure called runaway 336*⟩ ≡
procedure runaway;
var p: pointer; { head of runaway list }
begin if scanner_status > skipping then
begin case scanner_status of
  defining: begin print_nl("Runaway_definition"); p ← def_ref;
  end;
  matching: begin print_nl("Runaway_argument"); p ← temp_head;
  end;
  aligning: begin print_nl("Runaway_preamble"); p ← hold_head;
  end;
  end;
  absorbing: begin print_nl("Runaway_text"); p ← def_ref;
  end;
  end;
  end; { there are no other cases }
  print_char("?"); print_ln; show_token_list(link(p), null, error_line - 10);
  end;
  end;
end;
```

This code is used in section 141.

**338**\* The *param\_stack* is an auxiliary array used to hold pointers to the token lists for parameters at the current level and subsidiary levels of input. This stack is maintained with convention (2), and it grows at a different rate from the others.

```
\langle Global variables 13\rangle += param\_stack: \uparrow pointer; \{ token list pointers for parameters \} param\_ptr: 0 . . param\_size; \{ first unused entry in param\_stack \} max\_param\_stack: integer; \{ largest value of param\_ptr, will be \leq param\_size + 9 \}
```

**358**\* The *begin\_file\_reading* procedure starts a new level of input for lines of characters to be read from a file, or as an insertion from the terminal. It does not take care of opening the file, nor does it set *loc* or *limit* or *line*.

```
procedure begin_file_reading;
  begin if in\_open = max.in\_open then overflow("text_1.input_1.levels", <math>max.in\_open);
  if first = buf_size then overflow("buffer_size", buf_size);
   incr(in\_open); push\_input; index \leftarrow in\_open; source\_filename\_stack[index] \leftarrow 0;
  full\_source\_filename\_stack[index] \leftarrow 0; \ eof\_seen[index] \leftarrow false; \ grp\_stack[index] \leftarrow cur\_boundary;
   if\_stack[index] \leftarrow cond\_ptr; line\_stack[index] \leftarrow line; start \leftarrow first; state \leftarrow mid\_line; name \leftarrow 0;
         { terminal_input is now true }
   \langle \text{Prepare terminal input } SyncT_{FX} \text{ information } 1718* \rangle;
   end:
361.* To get TFX's whole input mechanism going, we perform the following actions.
\langle \text{Initialize the input routines } 361^* \rangle \equiv
  begin input\_ptr \leftarrow 0; max\_in\_stack \leftarrow 0; source\_filename\_stack[0] \leftarrow 0;
  full\_source\_filename\_stack[0] \leftarrow 0; in\_open \leftarrow 0; open\_parens \leftarrow 0; max\_buf\_stack \leftarrow 0; grp\_stack[0] \leftarrow 0;
   if\_stack[0] \leftarrow null; param\_ptr \leftarrow 0; max\_param\_stack \leftarrow 0; first \leftarrow buf\_size;
  repeat buffer[first] \leftarrow 0; decr(first);
  until first = 0;
   scanner\_status \leftarrow normal; warning\_index \leftarrow null; first \leftarrow 1; state \leftarrow new\_line; start \leftarrow 1; index \leftarrow 0;
   line \leftarrow 0; name \leftarrow 0; force\_eof \leftarrow false; align\_state \leftarrow 1000000;
  if ¬init_terminal then goto final_end;
   limit \leftarrow last; first \leftarrow last + 1; { init\_terminal has set loc and last }
```

This code is used in section 1392\*.

```
368* ⟨Tell the user what has run away and try to recover 368*⟩ ≡
begin runaway; {print a definition, argument, or preamble}
if cur_cs = 0 then print_err("File_ended")
else begin cur_cs ← 0; print_err("Forbidden_control_sequence_found");
end;
⟨Print either 'definition' or 'use' or 'preamble' or 'text', and insert tokens that should lead to
recovery 369*⟩;
print("_of_"); sprint_cs(warning_index);
help4("I_ususpect_you_have_forgotten_a_`}´,_causing_me")
("to_read_past_where_you_wanted_me_to_stop.")

p ← get_avail; link(p) ← q; info(p) ← cs_token_flag + frozen_cr; align_state ← -10000000;
end;
absorbing: begin print("_while_scanning_text"); info(p) ← right_brace_token + "}";
end;
end; { there are no other cases }
ins_list(p)
This code is used in section 368*.
```

**396\*** Expanding the next token. Only a dozen or so command codes > max\_command can possibly be returned by get\_next; in increasing order, they are undefined\_cs, expand\_after, no\_expand, input, if\_test, fi\_or\_else, cs\_name, convert, the, top\_bot\_mark, call, long\_call, outer\_call, long\_outer\_call, and end\_template.

The expand subroutine is used when  $cur\_cmd > max\_command$ . It removes a "call" or a conditional or one of the other special operations just listed. It follows that expand might invoke itself recursively. In all cases, expand destroys the current token, but it sets things up so that the next  $get\_next$  will deliver the appropriate next token. The value of  $cur\_tok$  need not be known when expand is called.

Since several of the basic scanning routines communicate via global variables, their values are saved as local variables of *expand* so that recursive calls don't invalidate them.

```
(Declare the procedure called macro_call 423)

 $\S546$  XaTeX Part 29: file names 67

548.\* The file names we shall deal with have the following structure: If the name contains '/' or ':' (for Amiga only), the file area consists of all characters up to and including the final such character; otherwise the file area is null. If the remaining file name contains '.', the file extension consists of all such characters from the last '.' to the end, otherwise the file extension is null.

We can scan such file names easily by using two global variables that keep track of the occurrences of area and extension delimiters:

```
\langle \text{Global variables } 13 \rangle +\equiv area\_delimiter: pool\_pointer; { the most recent '/', if any } ext\_delimiter: pool\_pointer; { the most recent '.', if any } file\_name\_quote\_char: UTF16\_code;
```

**549**\* Input files that can't be found in the user's area may appear in a standard system area called  $TEX\_area$ . Font metric files whose areas are not given explicitly are assumed to appear in a standard system area called  $TEX\_font\_area$ . These system area names will, of course, vary from place to place.

In C, the default paths are specified separately.

550.\* Here now is the first of the system-dependent routines for file name scanning.

```
procedure begin_name;
```

```
begin area\_delimiter \leftarrow 0; ext\_delimiter \leftarrow 0; quoted\_filename \leftarrow false; file\_name\_quote\_char \leftarrow 0; end;
```

**551**\* And here's the second. The string pool might change as the file name is being scanned, since a new \csname might be entered; therefore we keep area\_delimiter and ext\_delimiter relative to the beginning of the current string, instead of assigning an absolute address like pool\_ptr to them.

```
function more\_name(c: ASCII\_code): boolean;

begin if stop\_at\_space \land (c = "\_") \land (file\_name\_quote\_char = 0) then more\_name \leftarrow false

else if stop\_at\_space \land (file\_name\_quote\_char \neq 0) \land (c = file\_name\_quote\_char) then

begin file\_name\_quote\_char \leftarrow 0; more\_name \leftarrow true;

end

else if stop\_at\_space \land (file\_name\_quote\_char = 0) \land ((c = """") \lor (c = """)) then

begin file\_name\_quote\_char \leftarrow c; quoted\_filename \leftarrow true; more\_name \leftarrow true;

end

else begin str\_room(1); append\_char(c); { contribute c to the current string }

if IS\_DIR\_SEP(c) then

begin area\_delimiter \leftarrow cur\_length; ext\_delimiter \leftarrow 0;

end

else if c = "." then ext\_delimiter \leftarrow cur\_length;

more\_name \leftarrow true;

end;

end;
```

68 PART 29: FILE NAMES  $X_{\overline{3}}$ TEX §552

**552**\* The third. If a string is already in the string pool, the function <code>slow\_make\_string</code> does not create a new string but returns this string number, thus saving string space. Because of this new property of the returned string number it is not possible to apply <code>flush\_string</code> to these strings.

```
procedure end_name;
  var temp_str: str_number; { result of file name cache lookups }
     j: pool_pointer; { running index }
  begin if str\_ptr + 3 > max\_strings then overflow("number\_of\_strings", max\_strings - init\_str\_ptr);
  if area\_delimiter = 0 then cur\_area \leftarrow ""
  else begin cur\_area \leftarrow str\_ptr; str\_start\_macro(str\_ptr + 1) \leftarrow str\_start\_macro(str\_ptr) + area\_delimiter;
     incr(str\_ptr); temp\_str \leftarrow search\_string(cur\_area);
     if temp_str > 0 then
       begin cur\_area \leftarrow temp\_str; decr(str\_ptr); \{no flush\_string, pool\_ptr will be wrong!\}
       for j \leftarrow str\_start\_macro(str\_ptr + 1) to pool\_ptr - 1 do
          begin str\_pool[j - area\_delimiter] \leftarrow str\_pool[j];
          end;
       pool\_ptr \leftarrow pool\_ptr - area\_delimiter; { update pool\_ptr }
     end;
  if ext\_delimiter = 0 then
     begin cur\_ext \leftarrow ""; cur\_name \leftarrow slow\_make\_string;
     end
  else begin cur\_name \leftarrow str\_ptr;
     str\_start\_macro(str\_ptr + 1) \leftarrow str\_start\_macro(str\_ptr) + ext\_delimiter - area\_delimiter - 1;
     incr(str\_ptr); cur\_ext \leftarrow make\_string; decr(str\_ptr);  { undo extension string to look at name part }
     temp\_str \leftarrow search\_string(cur\_name);
     if temp\_str > 0 then
       begin cur\_name \leftarrow temp\_str; decr(str\_ptr); \{ no flush\_string, pool\_ptr will be wrong! \}
       for j \leftarrow str\_start\_macro(str\_ptr + 1) to pool\_ptr - 1 do
          begin str\_pool[j - ext\_delimiter + area\_delimiter + 1] \leftarrow str\_pool[j];
       pool\_ptr \leftarrow pool\_ptr - ext\_delimiter + area\_delimiter + 1;  { update pool\_ptr }
     cur\_ext \leftarrow slow\_make\_string; { remake extension string }
     end;
  end;
```

 $\S553$  X $_{
m HTE}$ X PART 29: FILE NAMES 69

553\* Conversely, here is a routine that takes three strings and prints a file name that might have produced them. (The routine is system dependent, because some operating systems put the file area last instead of first.)

```
define check\_quoted(\#) \equiv \{ check \text{ if string } \# \text{ needs quoting } \}
          if \# \neq 0 then
            begin j \leftarrow str\_start\_macro(\#);
             while ((\neg must\_quote) \lor (quote\_char = 0)) \land (j < str\_start\_macro(\# + 1)) do
               begin if str\_pool[j] = " \sqcup " then must\_quote \leftarrow true
               else if (str\_pool[j] = """") \lor (str\_pool[j] = """) then
                    begin must\_quote \leftarrow true; quote\_char \leftarrow """" + "`" - str\_pool[i];
                     end;
               incr(j);
               end;
             end
  define print\_quoted(\#) \equiv \{ print string \#, omitting quotes \} \}
          if \# \neq 0 then
            for j \leftarrow str\_start\_macro(\#) to str\_start\_macro(\#+1) - 1 do
               begin if str\_pool[j] = quote\_char then
                  begin print(quote\_char); quote\_char \leftarrow """" + """ - quote\_char; print(quote\_char);
                  end;
               print(str\_pool[j]);
               end
\langle \text{ Basic printing procedures 57} \rangle + \equiv
procedure print\_file\_name(n, a, e : integer);
  var must_quote: boolean; { whether to quote the filename }
     quote_char: integer; { current quote char (single or double) }
     j: pool_pointer; { index into str_pool }
  begin must\_quote \leftarrow false; quote\_char \leftarrow 0; check\_quoted(a); check\_quoted(n); check\_quoted(e);
  if must_quote then
     begin if quote\_char = 0 then quote\_char \leftarrow """";
     print_char(quote_char);
     end;
  print\_quoted(a); print\_quoted(n); print\_quoted(e);
  if quote\_char \neq 0 then print\_char(quote\_char);
  end;
```

70 PART 29: FILE NAMES  $\chi_{\Xi} r_{\Xi} \chi_{\Xi} \chi_{\Xi} r_{\Xi} \chi_{\Xi} \chi_{\Xi} r_{\Xi} \chi_{\Xi} \chi_{\Xi} r_{\Xi} \chi_{\Xi} \chi_{\Xi} r_{\Xi} \chi_{\Xi} r_{\Xi} \chi_{\Xi} r_{\Xi} \chi_{\Xi} r_{\Xi} \chi_{\Xi} r_{\Xi} r_{\Xi} \chi_{\Xi} r_{\Xi} r_{\Xi}$ 

**554**\* Another system-dependent routine is needed to convert three internal TEX strings into the name\_of\_file value that is used to open files. The present code allows both lowercase and uppercase letters in the file name.

```
define append\_to\_name(\#) \equiv
              begin c \leftarrow \#; incr(k);
              if k \leq file\_name\_size then
                 begin if (c < 128) then name\_of\_file[k] \leftarrow c
                 else if (c < "800) then
                       begin name\_of\_file[k] \leftarrow \text{"CO} + c \operatorname{\mathbf{div}} \text{"40}; incr(k); name\_of\_file[k] \leftarrow \text{"80} + c \operatorname{\mathbf{mod}} \text{"40};
                       end
                    else begin name\_of\_file[k] \leftarrow \text{"E0} + c \operatorname{\mathbf{div}} \text{"1000}; incr(k);
                       name\_of\_file[k] \leftarrow "80 + (c \text{ mod } "1000) \text{ div } "40; incr(k);
                       name\_of\_file[k] \leftarrow "80 + (c \ \mathbf{mod} \ "1000) \ \mathbf{mod} \ "40;
                 end
              end
procedure pack\_file\_name(n, a, e : str\_number);
  var k: integer; { number of positions filled in name_of_file }
     c: ASCII_code; { character being packed }
     j: pool_pointer; { index into str_pool }
  begin k \leftarrow 0;
  if name_of_file then libc_free(name_of_file);
  name\_of\_file \leftarrow xmalloc\_array(UTF8\_code, (length(a) + length(n) + length(e)) * 3 + 1);
  for j \leftarrow str\_start\_macro(a) to str\_start\_macro(a+1) - 1 do append\_to\_name(so(str\_pool[j]));
  for j \leftarrow str\_start\_macro(n) to str\_start\_macro(n+1) - 1 do append\_to\_name(so(str\_pool[j]));
  \mathbf{for} \ j \leftarrow str\_start\_macro(e) \ \mathbf{to} \ str\_start\_macro(e+1) - 1 \ \mathbf{do} \ append\_to\_name(so(str\_pool[j]));
  if k \leq file\_name\_size then name\_length \leftarrow k else name\_length \leftarrow file\_name\_size;
  name\_of\_file[name\_length + 1] \leftarrow 0;
  end;
```

**555**.\* A messier routine is also needed, since format file names must be scanned before TEX's string mechanism has been initialized. We shall use the global variable TEX\_format\_default to supply the text for default system areas and extensions related to format files.

Under UNIX we don't give the area part, instead depending on the path searching that will happen during file opening. Also, the length will be set in the main program.

```
define format\_area\_length = 0 { length of its area part } define format\_ext\_length = 4 { length of its '.fmt' part } define format\_extension = ".fmt" { the extension, as a WEB constant } \langle Global variables 13\rangle +\equiv format\_default\_length: integer; TEX\_format\_default: cstring;
```

**556**\* We set the name of the default format file and the length of that name in C, instead of Pascal, since we want them to depend on the name of the program.

 $\S558$   $X_{\overline{2}}I_{\overline{E}}X$  PART 29: FILE NAMES 71

**558.\*** Here is the messy routine that was just mentioned. It sets  $name\_of\_file$  from the first n characters of  $TEX\_format\_default$ , followed by  $buffer[a \ .. \ b]$ , followed by the last  $format\_ext\_length$  characters of  $TEX\_format\_default$ .

We dare not give error messages here, since TEX calls this routine before the *error* routine is ready to roll. Instead, we simply drop excess characters, since the error will be detected in another way when a strange file name isn't found.

```
procedure pack\_buffered\_name(n:small\_number; a, b:integer);
  var k: integer; { number of positions filled in name_of_file }
     c: ASCII_code; { character being packed }
     j: integer; { index into buffer or TEX_format_default }
  begin if n + b - a + 1 + format\_ext\_length > file\_name\_size then
     b \leftarrow a + file\_name\_size - n - 1 - format\_ext\_length;
  k \leftarrow 0:
  if name_of_file then libc_free(name_of_file);
  name\_of\_file \leftarrow xmalloc\_array(UTF8\_code, n + (b - a + 1) + format\_ext\_length + 1);
  for j \leftarrow 1 to n do append\_to\_name(TEX\_format\_default[j]);
  for j \leftarrow a to b do append\_to\_name(buffer[j]);
  for j \leftarrow format\_default\_length - format\_ext\_length + 1 to format\_default\_length do
     append\_to\_name(TEX\_format\_default[j]);
  if k < file\_name\_size then name\_length \leftarrow k else name\_length \leftarrow file\_name\_size;
  name\_of\_file[name\_length + 1] \leftarrow 0;
  end;
559* Here is the only place we use pack_buffered_name. This part of the program becomes active when a
"virgin" T<sub>F</sub>X is trying to get going, just after the preliminary initialization, or when the user is substituting
another format file by typing '&' after the initial '**' prompt. The buffer contains the first line of input in
buffer[loc...(last-1)], where loc < last and <math>buffer[loc] \neq " \sqcup ".
\langle \text{ Declare the function called } open\_fmt\_file 559* \rangle \equiv
function open\_fmt\_file: boolean;
  label found, exit;
  var j: 0 \dots buf\_size; { the first space after the format file name }
  begin j \leftarrow loc;
  if buffer[loc] = "%" then
     begin incr(loc); j \leftarrow loc; buffer[last] \leftarrow " ";
     while buffer[j] \neq " \sqcup " do incr(j);
     pack\_buffered\_name(0, loc, j - 1); { Kpathsea does everything }
     if w_{-open_{-}in}(fmt_{-}file) then goto found;
     wake_up_terminal; wterm('Sorry, \( \_\_\_\_\_\_\_\_\);
     fputs(stringcast(name_of_file + 1), stdout); wterm(``; \unwillutry\uninfty);
     fputs(\mathit{TEX\_format\_default} + 1, stdout); \ wterm\_ln(```.`); \ update\_terminal;
     end; { now pull out all the stops: try for the system plain file }
  pack\_buffered\_name(format\_default\_length - format\_ext\_length, 1, 0);
  if \neg w\_open\_in(fmt\_file) then
     begin wake_up_terminal; wterm(`I_can``t_find_the_format_file_``);
     fputs(TEX\_format\_default + 1, stdout); wterm\_ln(```!`); open\_fmt\_file \leftarrow false; return;
     end:
found: loc \leftarrow j; open\_fmt\_file \leftarrow true;
exit: \mathbf{end};
```

This code is used in section 1358\*.

72 PART 29: FILE NAMES  $X_{\overline{4}}T_{EX}$  §560

**560\*** Operating systems often make it possible to determine the exact name (and possible version number) of a file that has been opened. The following routine, which simply makes a  $T_{EX}$  string from the value of  $name\_of\_file$ , should ideally be changed to deduce the full name of file f, which is the file most recently opened, if it is possible to do this in a Pascal program.

This routine might be called after string memory has overflowed, hence we dare not use 'str\_room'.

```
function make_name_string: str_number;
  \mathbf{var} \ k: \ 0 \dots file\_name\_size; \ \{ index into \ name\_of\_file \}
     save_area_delimiter, save_ext_delimiter: pool_pointer;
     save_name_in_progress, save_stop_at_space: boolean;
  begin if (pool\_ptr + name\_length > pool\_size) \lor (str\_ptr = max\_strings) \lor (cur\_length > 0) then
     make\_name\_string \leftarrow "?"
  else begin make_utf16_name;
     for k \leftarrow 0 to name\_length16 - 1 do append\_char(name\_of\_file16[k]);
     make\_name\_string \leftarrow make\_string; { At this point we also set cur\_name, cur\_ext, and cur\_area to
          match the contents of name_of_file.}
     save\_area\_delimiter \leftarrow area\_delimiter; save\_ext\_delimiter \leftarrow ext\_delimiter;
     save\_name\_in\_progress \leftarrow name\_in\_progress; save\_stop\_at\_space \leftarrow stop\_at\_space;
     name\_in\_progress \leftarrow true; begin\_name; stop\_at\_space \leftarrow false; k \leftarrow 0;
     while (k < name\_length16) \land (more\_name(name\_of\_file16[k])) do incr(k);
     stop\_at\_space \leftarrow save\_stop\_at\_space; \ end\_name; \ name\_in\_progress \leftarrow save\_name\_in\_progress;
     area\_delimiter \leftarrow save\_area\_delimiter; ext\_delimiter \leftarrow save\_ext\_delimiter;
     end;
  end;
function u\_make\_name\_string(\mathbf{var}\ f: unicode\_file): str\_number;
  begin u\_make\_name\_string \leftarrow make\_name\_string;
  end;
function a\_make\_name\_string(\mathbf{var}\ f: alpha\_file): str\_number;
  begin a\_make\_name\_string \leftarrow make\_name\_string;
  end:
function b\_make\_name\_string(\mathbf{var}\ f:byte\_file): str\_number;
  begin b\_make\_name\_string \leftarrow make\_name\_string;
  end;
function w_make_name_string(\mathbf{var}\ f: word_file): str_number;
  begin w\_make\_name\_string \leftarrow make\_name\_string;
  end;
```

 $\S 561$  X<sub>2</sub>T<sub>E</sub>X PART 29: FILE NAMES 73

**561**.\* Now let's consider the "driver" routines by which TEX deals with file names in a system-independent manner. First comes a procedure that looks for a file name in the input by calling get\_x\_token for the information.

```
procedure scan_file_name;
  label done;
  var save_warning_index: pointer;
  begin save\_warning\_index \leftarrow warning\_index; warning\_index \leftarrow cur\_cs;
       \{ \text{ store } cur\_cs \text{ here to remember until later } \}
  (Get the next non-blank non-relax non-call token 438);
       { here the program expands tokens and removes spaces and \relaxes from the input. The \relax
       removal follows LuaTeX"s implementation, and other cases of balanced text scanning.
  back_input; { return the last token to be read by either code path }
  if cur\_cmd = left\_brace then scan\_file\_name\_braced
  else begin name_in_progress \leftarrow true; begin_name; \langle Get the next non-blank non-call token 440 <math>\rangle;
    loop begin if (cur\_cmd > other\_char) \lor (cur\_chr > biggest\_char) then { not a character }
         begin back_input; goto done;
         end;
       if \neg more\_name(cur\_chr) then goto done;
       get\_x\_token;
       end;
    end;
done: end\_name; name\_in\_progress \leftarrow false; warning\_index \leftarrow save\_warning\_index;
       { restore warning_index }
  end;
```

74 PART 29: FILE NAMES  $\chi_{\Xi}$  §565

**565**\* If some trouble arises when  $T_EX$  tries to open a file, the following routine calls upon the user to supply another file name. Parameter s is used in the error message to identify the type of file; parameter e is the default extension if none is given. Upon exit from the routine, variables  $cur\_name$ ,  $cur\_area$ ,  $cur\_ext$ , and  $name\_of\_file$  are ready for another attempt at file opening.

```
procedure prompt\_file\_name(s, e : str\_number);
  label done;
  \mathbf{var} \ k: \ 0 \dots buf\_size; \ \{ \text{ index into } buffer \}
     saved_cur_name: str_number; { to catch empty terminal input }
     saved\_cur\_ext\colon\thinspace str\_number;\quad \{\text{ to catch empty terminal input}\ \}
     saved_cur_area: str_number; { to catch empty terminal input }
  begin if interaction = scroll\_mode then wake\_up\_terminal;
  if s = "input_{\square}file_{\square}name" then print_err("I_{\square}can't_{\square}find_{\square}file_{\square}")
  else print_err("I_can t_write_on_file_");
  print_file_name(cur_name, cur_area, cur_ext); print("'.");
  if (e = ".tex") \lor (e = "") then show\_context;
  print_ln; print_c_string(prompt_file_name_help_msg);
  if (e \neq "") then
     begin print("; \_default\_file\_extension\_is\_`"); print(e); print("`");
  print(")"); print_ln; print_nl("Please_type_another_"); print(s);
  if interaction < scroll\_mode then fatal\_error("***_{\sqcup}(job_{\sqcup}aborted,_{\sqcup}file_{\sqcup}error_{\sqcup}in_{\sqcup}nonstop_{\sqcup}mode)");
  saved\_cur\_name \leftarrow cur\_name; saved\_cur\_ext \leftarrow cur\_ext; saved\_cur\_area \leftarrow cur\_area; clear\_terminal;
  prompt\_input(":"); \langle Scan file name in the buffer 566 \rangle;
  if (length(cur\_name) = 0) \land (cur\_ext = "") \land (cur\_area = "") then
     begin cur\_name \leftarrow saved\_cur\_name; cur\_ext \leftarrow saved\_cur\_ext; cur\_area \leftarrow saved\_cur\_area;
     end
  else if cur_ext = "" then cur_ext \leftarrow e;
  pack_cur_name;
  end;
567. Here's an example of how these conventions are used. Whenever it is time to ship out a box of stuff,
we shall use the macro ensure_dvi_open.
  define log\_name \equiv texmf\_log\_name
  define ensure\_dvi\_open \equiv
            if output\_file\_name = 0 then
               begin if job\_name = 0 then open\_log\_file;
               pack_job_name(output_file_extension);
               while \neg dvi\_open\_out(dvi\_file) do
                  prompt\_file\_name("file\_name\_for\_output", output\_file\_extension);
               output\_file\_name \leftarrow b\_make\_name\_string(dvi\_file);
               end
\langle \text{Global variables } 13 \rangle + \equiv
output_file_extension: str_number;
no\_pdf\_output: boolean;
dvi_file: byte_file; { the device-independent output goes here }
output_file_name: str_number; { full name of the output file }
log_name: str_number; { full name of the log file }
```

 $\S572$  X $_{\overline{\text{MTEX}}}$  PART 29: FILE NAMES 77

572\* Let's turn now to the procedure that is used to initiate file reading when an '\input' command is being processed. Beware: For historic reasons, this code foolishly conserves a tiny bit of string pool space; but that can confuse the interactive 'E' option.

```
procedure start_input; { TEX will \input something }
  label done;
  var temp_str: str_number; v: pointer; k: 0 .. file_name_size; { index into name_of_file16 }
  begin scan_file_name; { set cur_name to desired file name }
  pack_cur_name;
  loop begin begin_file_reading; { set up cur_file and new level of input }
    tex\_input\_type \leftarrow 1;  { Tell open\_input we are \input.}
       { Kpathsea tries all the various ways to get the file. }
    if kpse\_in\_name\_ok(stringcast(name\_of\_file + 1)) \land u\_open\_in(cur\_file, kpse\_tex\_format,
            XeTeX\_default\_input\_mode, XeTeX\_default\_input\_encoding) then
            { At this point name_of_file contains the actual name found, as a UTF8 string. We convert to
            UTF16, then extract the cur_area, cur_name, and cur_ext from it.}
       begin make\_utf16\_name; name\_in\_progress \leftarrow true; begin\_name; stop\_at\_space \leftarrow false; k \leftarrow 0;
       while (k < name\_length16) \land (more\_name(name\_of\_file16[k])) do incr(k);
       stop\_at\_space \leftarrow true; end\_name; name\_in\_progress \leftarrow false; goto done;
     end_file_reading; { remove the level that didn't work }
    prompt_file_name("input_file_name", "");
done: name \leftarrow a\_make\_name\_string(cur\_file); source\_filename\_stack[in\_open] \leftarrow name;
  full\_source\_filename\_stack[in\_open] \leftarrow make\_full\_name\_string;
  if name = str_ptr - 1 then { we can try to conserve string pool space now }
    begin temp\_str \leftarrow search\_string(name);
    if temp\_str > 0 then
       begin name \leftarrow temp\_str; flush\_string;
       end;
    end;
  if job\_name = 0 then
    begin job\_name \leftarrow get\_job\_name(cur\_name); open\_log\_file;
    end; { open_log_file doesn't show_context, so limit and loc needn't be set to meaningful values yet }
  if term\_offset + length(full\_source\_filename\_stack[in\_open]) > max\_print\_line - 2 then print\_ln

    if v < tracing\_stack\_levels then
       while v > 0 do
         begin print\_char("."); decr(v);
         end
    else print_char("~");
    slow_print("INPUT_"); slow_print(cur_name); slow_print(cur_ext); print_ln; end_diagnostic(false);
    end:
  state \leftarrow new\_line; \langle Prepare new file SyncT_{FX} information 1717* \rangle;
  \langle \text{ Read the first line of the new file 573} \rangle;
  end;
```

**583**\* So that is what TFM files hold. Since TEX has to absorb such information about lots of fonts, it stores most of the data in a large array called *font\_info*. Each item of *font\_info* is a *memory\_word*; the *fix\_word* data gets converted into *scaled* entries, while everything else goes into words of type *four\_quarters*.

When the user defines f, say, f assigns an internal number to the user's font f. Adding this number to f and f are gives the f assigns an internal number to the user's font f. Adding this number to f are f as f and f are f as f as f and f are f as f as f as f and f are f as f and f are f as f as f and f are f are f and f are f and f are f and f are f are f and f are f are f and f are f and f are f are f and f are f are f and f are f and f are f and f are f are f and f are f are f and f are f are f are f are f are f and f are f are f and f are f are f and f are f are f are f are f are f and f are f and f are f are f are f and f are f are f and f are f and f are f are f are f and f are f are f and f are f are f are f are f and f are f are f are f are f and f are f are f and f are f are f and f are f are f are f are f are f and f are f and f are f are f are f are f are f and f are f are f and f are f

```

```

**585.\*** Besides the arrays just enumerated, we have directory arrays that make it easy to get at the individual entries in  $font\_info$ . For example, the  $char\_info$  data for character c in font f will be in  $font\_info[char\_base[f] + c].qqqq$ ; and if w is the  $width\_index$  part of this word (the b0 field), the width of the character is  $font\_info[width\_base[f] + w].sc$ . (These formulas assume that  $min\_quarterword$  has already been added to c and to w, since TeX stores its quarterwords that way.)

```
\langle \text{Global variables } 13 \rangle + \equiv
char_base: \(\gamma\integer\); \{\text{base addresses for } char_info\}
width\_base: \uparrow integer;
                            { base addresses for widths }
height\_base: \uparrow integer;
                            { base addresses for heights }
depth\_base: \uparrow integer;  { base addresses for depths }
italic\_base: \uparrow integer;
                           { base addresses for italic corrections }
lig_kern_base: ↑integer; { base addresses for ligature/kerning programs }
kern\_base: \uparrow integer;  { base addresses for kerns }
exten_base: \forall integer; \{\text{ base addresses for extensible recipes}\}\)
param\_base: \uparrow integer;
                            { base addresses for font parameters }
        \langle Set initial values of key variables 23*\rangle +\equiv
586*
```

587.\* TEX always knows at least one font, namely the null font. It has no characters, and its seven parameters are all equal to zero.

 $\langle \text{Initialize table entries (done by INITEX only) } 189 \rangle + \equiv$ 

**589\*** Of course we want to define macros that suppress the detail of how font information is actually packed, so that we don't have to write things like

$$font\_info[width\_base[f] + font\_info[char\_base[f] + c].qqqq.b0].sc$$

too often. The WEB definitions here make  $char\_info(f)(c)$  the  $four\_quarters$  word of font information corresponding to character c of font f. If q is such a word,  $char\_width(f)(q)$  will be the character's width; hence the long formula above is at least abbreviated to

$$char\_width(f)(char\_info(f)(c)).$$

Usually, of course, we will fetch q first and look at several of its fields at the same time.

The italic correction of a character will be denoted by  $char\_italic(f)(q)$ , so it is analogous to  $char\_width$ . But we will get at the height and depth in a slightly different way, since we usually want to compute both height and depth if we want either one. The value of  $height\_depth(q)$  will be the 8-bit quantity

```
b = height\_index \times 16 + depth\_index,
```

and if b is such a byte we will write  $char\_height(f)(b)$  and  $char\_depth(f)(b)$  for the height and depth of the character c for which  $q = char\_info(f)(c)$ . Got that?

The tag field will be called  $char\_tag(q)$ ; the remainder byte will be called  $rem\_byte(q)$ , using a macro that we have already defined above.

Access to a character's width, height, depth, and tag fields is part of TEX's inner loop, so we want these macros to produce code that is as fast as possible under the circumstances.

MLTEX will assume that a character c exists iff either exists in the current font or a character substitution definition for this character was defined using **\charsubdef**. To avoid the distinction between these two cases, MLTEX introduces the notion "effective character" of an input character c. If c exists in the current font, the effective character of c is the character c itself. If it doesn't exist but a character substitution is defined, the effective character of c is the base character defined in the character substitution. If there is an effective character for a non-existing character c, the "virtual character" c will get appended to the horizontal lists.

The effective character is used within *char\_info* to access appropriate character descriptions in the font. For example, when calculating the width of a box, MLT<sub>E</sub>X will use the metrics of the effective characters. For the case of a substitution, MLT<sub>E</sub>X uses the metrics of the base character, ignoring the metrics of the accent character.

If character substitutions are changed, it will be possible that a character c neither exists in a font nor there is a valid character substitution for c. To handle these cases effective\_char should be called with its first argument set to true to ensure that it will still return an existing character in the font. If neither c nor the substituted base character in the current character substitution exists, effective\_char will output a warning and return the character  $font_bc[f]$  (which is incorrect, but can not be changed within the current framework).

Sometimes character substitutions are unwanted, therefore the original definition of *char\_info* can be used using the macro *orig\_char\_info*. Operations in which character substitutions should be avoided are, for example, loading a new font and checking the font metric information in this font, and character accesses in math mode.

```
define char\_width\_end(\#) \equiv \#.b0] .sc
define char\_width(\#) \equiv font\_info [ width\_base[\#] + char\_width\_end
define char\_exists(\#) \equiv (\#.b0 > min\_quarterword)
define char\_italic\_end(\#) \equiv (qo(\#.b2)) div 4] .sc
define char\_italic(\#) \equiv font\_info [ italic\_base[\#] + char\_italic\_end
define height\_depth(\#) \equiv qo(\#.b1)
define char\_height\_end(\#) \equiv (\#) div 16] .sc
define char\_height(\#) \equiv font\_info [ height\_base[\#] + char\_height\_end
define char\_depth\_end(\#) \equiv (\#) mod 16] .sc

define char\_depth(\#) \equiv font\_info [ depth\_base[\#] + char\_depth\_end
define char\_tag(\#) \equiv ((qo(\#.b2))) mod 4)
```

T<sub>F</sub>X checks the information of a TFM file for validity as the file is being read in, so that no further checks will be needed when typesetting is going on. The somewhat tedious subroutine that does this is called read\_font\_info. It has four parameters: the user font identifier u, the file name and area strings nom and aire, and the "at" size s. If s is negative, it's the negative of a scale factor to be applied to the design size; s = -1000 is the normal case. Otherwise s will be substituted for the design size; in this case, s must be positive and less than 2048 pt (i.e., it must be less than 2<sup>27</sup> when considered as an integer).

The subroutine opens and closes a global file variable called  $tfm_{-}file$ . It returns the value of the internal font number that was just loaded. If an error is detected, an error message is issued and no font information is stored; null\_font is returned in this case.

```

  end; { of procedure }
See also section 744.
This code is used in section 1695*.
```

617.\* The subroutines for new\_character have been moved.

**618**\* Here is a function that returns a pointer to a character node for a given character in a given font. If that character doesn't exist, *null* is returned instead.

This allows a character node to be used if there is an equivalent in the char\_sub\_code list.

```
function new\_character(f:internal\_font\_number; c:ASCII\_code): pointer;
label exit;
var p: pointer; { newly allocated node }
ec: quarterword; { effective character of c }
begin if is\_native\_font(f) then
  begin new\_character \leftarrow new\_native\_character(f,c); return;
end;
ec \leftarrow effective\_char(false, f, qi(c));
if font\_bc[f] \leq qo(ec) then
  if font\_ec[f] \geq qo(ec) then
  if char\_exists(orig\_char\_info(f)(ec)) then { N.B.: not char\_info }
  begin p \leftarrow get\_avail; font(p) \leftarrow f; character(p) \leftarrow qi(c); new\_character \leftarrow p; return;
end;
char\_warning(f,c); new\_character \leftarrow null;
exit: end;
```

628\* Shipping pages out. After considering T<sub>F</sub>X's eyes and stomach, we come now to the bowels.

The ship\_out procedure is given a pointer to a box; its mission is to describe that box in DVI form, outputting a "page" to  $dvi_{-}file$ . The DVI coordinates (h,v)=(0,0) should correspond to the upper left corner of the box being shipped.

Since boxes can be inside of boxes inside of boxes, the main work of ship\_out is done by two mutually recursive routines, hlist\_out and vlist\_out, which traverse the hlists and vlists inside of horizontal and vertical boxes.

As individual pages are being processed, we need to accumulate information about the entire set of pages, since such statistics must be reported in the postamble. The global variables total\_pages, max\_v, max\_h, max\_push, and last\_bop are used to record this information.

The variable doing\_leaders is true while leaders are being output. The variable dead\_cycles contains the number of times an output routine has been initiated since the last *ship\_out*.

A few additional global variables are also defined here for use in vlist\_out and hlist\_out. They could have been local variables, but that would waste stack space when boxes are deeply nested, since the values of these variables are not needed during recursive calls.

```
\langle \text{Global variables } 13 \rangle + \equiv
total_pages: integer; { the number of pages that have been shipped out }
max_v: scaled; { maximum height-plus-depth of pages shipped so far }
max_h: scaled; { maximum width of pages shipped so far }
max_push: integer; { deepest nesting of push commands encountered so far }
last_bop: integer; { location of previous bop in the DVI output }
dead_cycles: integer; { recent outputs that didn't ship anything out }
doing_leaders: boolean; { are we inside a leader box? }
    { character and font in current char_node }
c: quarterword:
f: internal_font_number;
rule_ht, rule_dp, rule_wd: scaled; { size of current rule being output }
g: pointer; { current glue specification }
lq, lr: integer; { quantities used in calculations for leaders }
```

Some systems may find it more efficient to make dvi-buf a packed array, since output of four bytes at once may be facilitated.

```
\langle \text{Global variables } 13 \rangle + \equiv
dvi\_buf: \uparrow eight\_bits;  { buffer for DVI output }
half_buf: integer; { half of dvi_buf_size }
dvi_limit: integer; { end of the current half buffer }
dvi_ptr: integer; { the next available buffer address }
dvi_offset: integer; { dvi_buf_size times the number of times the output buffer has been fully emptied }
dvi_gone: integer; { the number of bytes already output to dvi_file }
```

**633.\*** The actual output of  $dvi_buf[a ... b]$  to  $dvi_file$  is performed by calling  $write_dvi(a, b)$ . For best results, this procedure should be optimized to run as fast as possible on each particular system, since it is part of T<sub>E</sub>X's inner loop. It is safe to assume that a and b+1 will both be multiples of 4 when  $write_{-}dvi(a,b)$  is called; therefore it is possible on many machines to use efficient methods to pack four bytes per word and to output an array of words with one system call.

In C, we use a macro to call furite or write directly, writing all the bytes in one shot. Much better even than writing four bytes at a time.

**634\*** To put a byte in the buffer without paying the cost of invoking a procedure each time, we use the macro  $dvi\_out$ .

The length of dvi-file should not exceed "7FFFFFFF; we set cur- $s \leftarrow -2$  to prevent further DVI output causing infinite recursion.

```
define dvi_{-}out(\#) \equiv \mathbf{begin} \ dvi_{-}buf[dvi_{-}ptr] \leftarrow \#; \ incr(dvi_{-}ptr);
          if dvi_ptr = dvi_limit then dvi_swap;
          end
procedure dvi\_swap; { outputs half of the buffer }
  begin if dvi_ptr > ("7FFFFFFF - dvi_offset) then
     begin cur\_s \leftarrow -2; fatal\_error("dvi\_length\_exceeds\_""7FFFFFFF");
     end:
  if dvi\_limit = dvi\_buf\_size then
     begin write\_dvi(0, half\_buf - 1); dvi\_limit \leftarrow half\_buf; dvi\_offset \leftarrow dvi\_offset + dvi\_buf\_size;
     dvi_{-}ptr \leftarrow 0;
     end
  else begin write\_dvi(half\_buf, dvi\_buf\_size - 1); dvi\_limit \leftarrow dvi\_buf\_size;
  dvi\_gone \leftarrow dvi\_gone + half\_buf;
  end;
635.* Here is how we clean out the buffer when TeX is all through; dvi_ptr will be a multiple of 4.
\langle Empty the last bytes out of dvi_buf_{635}^*\rangle \equiv
  if dvi\_limit = half\_buf then write\_dvi(half\_buf, dvi\_buf\_size - 1);
  if dvi_ptr > ("7FFFFFFFF - dvi_offset) then
     begin cur\_s \leftarrow -2; fatal\_error("dvi\_length\_exceeds\_""7FFFFFFF");
     end:
  if dvi_ptr > 0 then write_dvi(0, dvi_ptr - 1)
This code is used in section 680*.
638.* Here's a procedure that outputs a font definition. Since TFX82 uses at most 256 different fonts per
job, fnt\_def1 is always used as the command code.
procedure dvi_native_font_def(f:internal_font_number);

This code is used in sections 658\*, 1427, and 1431.

**658**\* We ought to give special care to the efficiency of one part of  $hlist\_out$ , since it belongs to  $T_EX$ 's inner loop. When a  $char\_node$  is encountered, we save a little time by processing several nodes in succession until reaching a non- $char\_node$ . The program uses the fact that  $set\_char\_0 = 0$ .

In MLTEX this part looks for the existence of a substitution definition for a character c, if c does not exist in the font, and create appropriate DVI commands. Former versions of MLTEX have spliced appropriate character, kern, and box nodes into the horizontal list. Because the user can change character substitutions or \charsubdefmax on the fly, we have to test a again for valid substitutions. (Additional it is necessary to be careful—if leaders are used the current hlist is normally traversed more than once!)

**793**. If the nucleus of an *op\_noad* is a single character, it is to be centered vertically with respect to the axis, after first being enlarged (via a character list in the font) if we are in display style. The normal convention for placing displayed limits is to put them above and below the operator in display style.

The italic correction is removed from the character if there is a subscript and the limits are not being displayed. The *make\_op* routine returns the value that should be used as an offset between subscript and superscript.

After  $make\_op$  has acted, subtype(q) will be limits if and only if the limits have been set above and below the operator. In that case,  $new\_hlist(q)$  will already contain the desired final box.

106 Part 42: hyphenation  $x_{\exists T_E X}$  §973

974. The patterns are stored in a compact table that is also efficient for retrieval, using a variant of "trie memory" [cf. The Art of Computer Programming 3 (1973), 481–505]. We can find each pattern  $p_1 
ldots p_k$  by letting  $z_0$  be one greater than the relevant language index and then, for 1 
ldots i 
ldots k, setting  $z_i \leftarrow trie\_link(z_{i-1}) + p_i$ ; the pattern will be identified by the number  $z_k$ . Since all the pattern information is packed together into a single  $trie\_link$  array, it is necessary to prevent confusion between the data from inequivalent patterns, so another table is provided such that  $trie\_char(z_i) = p_i$  for all i. There is also a table  $trie\_op(z_k)$  to identify the numbers  $n_0 
ldots n_k$  associated with  $p_1 
ldots p_k$ .

The theory that comparatively few different number sequences  $n_0 \dots n_k$  actually occur, since most of the n's are generally zero, seems to fail at least for the large German hyphenation patterns. Therefore the number sequences cannot any longer be encoded in such a way that  $trie\_op(z_k)$  is only one byte long. We have introduced a new constant  $max\_trie\_op$  for the maximum allowable hyphenation operation code value;  $max\_trie\_op$  might be different for TEX and INITEX and must not exceed  $max\_halfword$ . An opcode will occupy a halfword if  $max\_trie\_op$  exceeds  $max\_quarterword$  or a quarterword otherwise. If  $trie\_op(z_k) \neq min\_trie\_op$ , when  $p_1 \dots p_k$  has matched the letters in  $hc[(l-k+1) \dots l]$  of language t, we perform all of the required operations for this pattern by carrying out the following little program: Set  $v \leftarrow trie\_op(z_k)$ . Then set  $v \leftarrow v + op\_start[t]$ ,  $hyf[l-hyf\_distance[v]] \leftarrow max(hyf[l-hyf\_distance[v]], hyf\_num[v])$ , and  $v \leftarrow hyf\_next[v]$ ; repeat, if necessary, until  $v = min\_trie\_op$ .

```
\langle Types in the outer block 18\rangle += trie\_pointer = 0 ... ssup\_trie\_size; { an index into trie } trie\_opcode = 0 ... ssup\_trie\_opcode; { a trie opcode }
```

975.\* For more than 255 trie op codes, the three fields  $trie\_link$ ,  $trie\_char$ , and  $trie\_op$  will no longer fit into one memory word; thus using web2c we define trie as three array instead of an array of records. The variant will be implemented by reusing the opcode field later on with another macro.

```
define trie\_link(\#) \equiv trie\_trl[\#] { "downward" link in a trie } define trie\_char(\#) \equiv trie\_trc[\#] { character matched at this trie location } define trie\_op(\#) \equiv trie\_tro[\#] { program for hyphenation at this trie location } $$ (Global variables 13) + \equiv { We will dynamically allocate these arrays. } $$ trie\_trl: \particle trie\_pointer; { trie\_link } $$ trie\_trl: \particle trie\_pointer; { trie\_link } $$ trie\_trc: \particle quarterword; { trie\_char } $$ hyf\_distance: array [1 \ldots trie\_op\_size] of small\_number; { position k-j of n_j } hyf\_num: array [1 \ldots trie\_op\_size] of small\_number; { value of n_j } hyf\_next: array [1 \ldots trie\_op\_size] of trie\_opcode; { continuation code } $$ op\_start: array [0 \ldots biggest\_lang] of 0 \ldots trie\_op\_size; { offset for current language } $$
```

 $\S977$   $X_{\Xi}T_{EX}$  Part 42: hyphenation 107

977.\* Assuming that these auxiliary tables have been set up properly, the hyphenation algorithm is quite short. In the following code we set hc[hn + 2] to the impossible value 256, in order to guarantee that hc[hn + 3] will never be fetched.

```
\langle Find hyphen locations for the word in hc, or return 977*\rangle \equiv
  for j \leftarrow 0 to hn do hyf[j] \leftarrow 0;
  (Look for the word hc[1...hn] in the exception table, and goto found (with hyf containing the hyphens)
        if an entry is found 984*;
  if trie\_char(cur\_lang + 1) \neq qi(cur\_lang) then return; { no patterns for cur\_lang }
  hc[0] \leftarrow 0; hc[hn+1] \leftarrow 0; hc[hn+2] \leftarrow max\_hyph\_char; {insert delimiters}
  for j \leftarrow 0 to hn - r hyf + 1 do
     begin z \leftarrow trie\_link(cur\_lang + 1) + hc[j]; l \leftarrow j;
     while hc[l] = qo(trie\_char(z)) do
        begin if trie\_op(z) \neq min\_trie\_op then (Store maximum values in the hyf table 978*);
        incr(l); z \leftarrow trie\_link(z) + hc[l];
        end;
     end;
found: for j \leftarrow 0 to l\_hyf - 1 do hyf[j] \leftarrow 0;
  for j \leftarrow 0 to r \cdot hyf - 1 do hyf[hn - j] \leftarrow 0
This code is used in section 944.
978* \langle Store maximum values in the hyf table 978* \rangle \equiv
  begin v \leftarrow trie\_op(z);
  repeat v \leftarrow v + op\_start[cur\_lang]; i \leftarrow l - hyf\_distance[v];
     if hyf_num[v] > hyf[i] then hyf[i] \leftarrow hyf_num[v];
     v \leftarrow hyf_next[v];
  until v = min\_trie\_op;
  end
This code is used in section 977*.
```

979\* The exception table that is built by  $T_EX$ 's \hyphenation primitive is organized as an ordered hash table [cf. Amble and Knuth, The Computer Journal 17 (1974), 135–142] using linear probing. If  $\alpha$  and  $\beta$  are words, we will say that  $\alpha < \beta$  if  $|\alpha| < |\beta|$  or if  $|\alpha| = |\beta|$  and  $\alpha$  is lexicographically smaller than  $\beta$ . (The notation  $|\alpha|$  stands for the length of  $\alpha$ .) The idea of ordered hashing is to arrange the table so that a given word  $\alpha$  can be sought by computing a hash address  $h = h(\alpha)$  and then looking in table positions  $h, h - 1, \ldots$ , until encountering the first word  $\leq \alpha$ . If this word is different from  $\alpha$ , we can conclude that  $\alpha$  is not in the table. This is a clever scheme which saves the need for a hash link array. However, it is difficult to increase the size of the hyphen exception arrays. To make this easier, the ordered hash has been replaced by a simple hash, using an additional array  $hyph\_link$ . The value 0 in  $hyph\_link[k]$  means that there are no more entries corresponding to the specific hash chain. When  $hyph\_link[k] > 0$ , the next entry in the hash chain is  $hyph\_link[k] - 1$ . This value is used because the arrays start at 0.

The words in the table point to lists in *mem* that specify hyphen positions in their *info* fields. The list for  $c_1 
dots c_n$  contains the number k if the word  $c_1 
dots c_n$  has a discretionary hyphen between  $c_k$  and  $c_{k+1}$ .

```

  goto found;
not\_found:
```

This code is used in section 994\*.

997.\* Before we discuss trie building in detail, let's consider the simpler problem of creating the hyf\_distance,  $hyf_num$ , and  $hyf_next$  arrays.

Suppose, for example, that T<sub>F</sub>X reads the pattern 'ab2cde1'. This is a pattern of length 5, with  $n_0 \dots n_5 =$ 0.02001 in the notation above. We want the corresponding trie\_op code v to have  $hyf_{-}distance[v] = 3$ ,  $hyf_num[v] = 2$ , and  $hyf_next[v] = v'$ , where the auxiliary  $trie_op$  code v' has  $hyf_odistance[v'] = 0$ ,  $hyf_num[v'] = 1$ , and  $hyf_next[v'] = min_trie_op$ .

T<sub>E</sub>X computes an appropriate value v with the  $new\_trie\_op$  subroutine below, by setting

```
v' \leftarrow new\_trie\_op(0, 1, min\_trie\_op), \qquad v \leftarrow new\_trie\_op(3, 2, v').
```

This subroutine looks up its three parameters in a special hash table, assigning a new value only if these three have not appeared before for the current language.

The hash table is called *trie\_op\_hash*, and the number of entries it contains is *trie\_op\_ptr*.

```
\langle \text{Global variables } 13 \rangle + \equiv
  init trie_op_hash: array [neg_trie_op_size .. trie_op_size] of 0 .. trie_op_size;
         { trie op codes for quadruples }
trie_used: array [0.. biggest_lang] of trie_opcode; { largest opcode used so far for this language }
trie\_op\_lang: array [1...trie\_op\_size] of 0...biggest\_lang; {language part of a hashed quadruple}
trie_op_val: array [1.. trie_op_size] of trie_opcode; { opcode corresponding to a hashed quadruple }
trie\_op\_ptr: 0 ... trie\_op\_size; { number of stored ops so far }
  tini
max_op_used: trie_opcode; { largest opcode used for any language }
small_op: boolean; { flag used while dumping or undumping }
```

ХаТеХ

end

This code is used in section 1006.

998\* It's tempting to remove the overflow stops in the following procedure; new\_trie\_op could return min\_trie\_op (thereby simply ignoring part of a hyphenation pattern) instead of aborting the job. However, that would lead to different hyphenation results on different installations of TEX using the same patterns. The overflow stops are necessary for portability of patterns.

```
\langle Declare procedures for preprocessing hyphenation patterns 998* \rangle \equiv
function new\_trie\_op(d, n : small\_number; v : trie\_opcode): trie\_opcode;
  label exit;
  var h: neg_trie_op_size .. trie_op_size; { trial hash location }
     u: trie_opcode; { trial op code }
     l: 0 . . trie_op_size; { pointer to stored data }
  \mathbf{begin}\ h \leftarrow abs(n+313*d+361*v+1009*cur\_lang)\mathbf{mod}\ (trie\_op\_size - neg\_trie\_op\_size) + neg\_trie\_op\_size;
  loop begin l \leftarrow trie\_op\_hash[h];
     if l = 0 then { empty position found for a new op }
        begin if trie\_op\_ptr = trie\_op\_size then overflow("pattern\_memory\_ops", <math>trie\_op\_size);
        u \leftarrow trie\_used[cur\_lang];
        if u = max\_trie\_op then
           overflow("pattern_memory_ops_per_language", max\_trie\_op - min\_trie\_op);
        incr(trie\_op\_ptr); incr(u); trie\_used[cur\_lang] \leftarrow u;
        if u > max\_op\_used then max\_op\_used \leftarrow u;
        hyf\_distance[trie\_op\_ptr] \leftarrow d; \ hyf\_num[trie\_op\_ptr] \leftarrow n; \ hyf\_next[trie\_op\_ptr] \leftarrow v;
        trie\_op\_lang[trie\_op\_ptr] \leftarrow cur\_lang; trie\_op\_hash[h] \leftarrow trie\_op\_ptr; trie\_op\_val[trie\_op\_ptr] \leftarrow u;
        new\_trie\_op \leftarrow u; return;
        end;
     if (hyf\_distance[l] = d) \land (hyf\_num[l] = n) \land (hyf\_next[l] = v) \land (trie\_op\_lang[l] = cur\_lang) then
        begin new\_trie\_op \leftarrow trie\_op\_val[l]; return;
     if h > -trie\_op\_size then decr(h) else h \leftarrow trie\_op\_size;
     end:
exit: \mathbf{end};
See also sections 1002, 1003, 1007, 1011, 1013, 1014*, and 1020*.
This code is used in section 996.
        After new_trie_op has compressed the necessary opcode information, plenty of information is available
to unscramble the data into the final form needed by our hyphenation algorithm.
\langle Sort the hyphenation op tables into proper order 999*\rangle \equiv
  op\_start[0] \leftarrow -min\_trie\_op;
  for j \leftarrow 1 to biggest\_lang do op\_start[j] \leftarrow op\_start[j-1] + qo(trie\_used[j-1]);
  for j \leftarrow 1 to trie\_op\_ptr do trie\_op\_hash[j] \leftarrow op\_start[trie\_op\_lang[j]] + trie\_op\_val[j]; { destination }

        trie\_op\_hash[j] \leftarrow trie\_op\_hash[k]; trie\_op\_hash[k] \leftarrow k;
```

1000.\* Before we forget how to initialize the data structures that have been mentioned so far, let's write down the code that gets them started.

```
\langle Initialize table entries (done by INITEX only) 189\rangle +\equiv for k \leftarrow -trie\_op\_size to trie\_op\_size do trie\_op\_hash[k] \leftarrow 0; for k \leftarrow 0 to biggest\_lang do trie\_used[k] \leftarrow min\_trie\_op; max\_op\_used \leftarrow min\_trie\_op; trie\_op\_ptr \leftarrow 0;
```

1001. The linked trie that is used to preprocess hyphenation patterns appears in several global arrays. Each node represents an instruction of the form "if you see character c, then perform operation o, move to the next character, and go to node l; otherwise go to node r." The four quantities c, o, l, and r are stored in four arrays  $trie_{-}c$ ,  $trie_{-}o$ ,  $trie_{-}l$ , and  $trie_{-}r$ . The root of the trie is  $trie_{-}l[0]$ , and the number of nodes is  $trie_{-}ptr$ . Null trie pointers are represented by zero. To initialize the trie, we simply set  $trie_{-}l[0]$  and  $trie_{-}ptr$  to zero. We also set  $trie_{-}c[0]$  to some arbitrary value, since the algorithm may access it.

The algorithms maintain the condition

```
trie\_c[trie\_r[z]] > trie\_c[z] \qquad \text{whenever } z \neq 0 \text{ and } trie\_r[z] \neq 0; in other words, sibling nodes are ordered by their c fields.
```

```
define trie\_root \equiv trie\_l[0] { root of the linked trie } 
 \langle Global variables 13\rangle +\equiv init trie\_c: \uparrow packed\_ASCII\_code; { characters to match } trie\_o: \uparrow trie\_opcode; { operations to perform } trie\_l: \uparrow trie\_pointer; { left subtrie links } trie\_r: \uparrow trie\_pointer; { right subtrie links } trie\_ptr: trie\_pointer; { the number of nodes in the trie } trie\_hash: \uparrow trie\_pointer; { used to identify equivalent subtries } trie\_hash: \uparrow trie\_pointer; { used to identify equivalent subtries } trie\_hash: \uparrow trie\_pointer; { used to identify equivalent subtries }
```

1004. The compressed trie will be packed into the trie array using a "top-down first-fit" procedure. This is a little tricky, so the reader should pay close attention: The  $trie\_hash$  array is cleared to zero again and renamed  $trie\_ref$  for this phase of the operation; later on,  $trie\_ref[p]$  will be nonzero only if the linked trie node p is the smallest character in a family and if the characters c of that family have been allocated to locations  $trie\_ref[p] + c$  in the trie array. Locations of trie that are in use will have  $trie\_link = 0$ , while the unused holes in trie will be doubly linked with  $trie\_link$  pointing to the next larger vacant location and  $trie\_back$  pointing to the next smaller one. This double linking will have been carried out only as far as  $trie\_max$ , where  $trie\_max$  is the largest index of trie that will be needed. To save time at the low end of the trie, we maintain array entries  $trie\_min[c]$  pointing to the smallest hole that is greater than c. Another array  $trie\_taken$  tells whether or not a given location is equal to  $trie\_ref[p]$  for some p; this array is used to ensure that distinct nodes in the compressed trie will have distinct  $trie\_ref$  entries.

```
define trie_ref ≡ trie_hash { where linked trie families go into trie }
define trie_back(#) ≡ trie_tro[#] { use the opcode field now for backward links }

⟨ Global variables 13⟩ +≡
init trie_taken: ↑boolean; { does a family start here? }
trie_min: array [ASCII_code] of trie_pointer; { the first possible slot for each character }
trie_max: trie_pointer; { largest location used in trie }
trie_not_ready: boolean; { is the trie still in linked form? }
tini
```

end;

1005.\* Each time \patterns appears, it contributes further patterns to the future trie, which will be built only when hyphenation is attempted or when a format file is dumped. The boolean variable *trie\_not\_ready* will change to *false* when the trie is compressed; this will disable further patterns.

```
\langle Initialize table entries (done by INITEX only) 189\rangle + \equiv trie\_not\_ready \leftarrow true;
```

1012.\* When the whole trie has been allocated into the sequential table, we must go through it once again so that *trie* contains the correct information. Null pointers in the linked trie will be represented by the value 0, which properly implements an "empty" family.

```
define clear\_trie \equiv \{ clear trie[r] \}
          begin trie\_link(r) \leftarrow 0; trie\_op(r) \leftarrow min\_trie\_op; trie\_char(r) \leftarrow min\_quarterword;
               \{ trie\_char \leftarrow qi(0) \}
          end
\langle Move the data into trie 1012*\rangle \equiv
  if trie_max = 0 then { no patterns were given }
     begin for r \leftarrow 0 to max\_hyph\_char do clear\_trie;
     trie\_max \leftarrow max\_hyph\_char;
     end
  else begin if hyph\_root > 0 then trie\_fix(hyph\_root);
     if trie\_root > 0 then trie\_fix(trie\_root); { this fixes the non-holes in trie }
     r \leftarrow 0; { now we will zero out all the holes }
     repeat s \leftarrow trie\_link(r); clear\_trie; r \leftarrow s;
     until r > trie\_max;
     end:
  trie\_char(0) \leftarrow qi("?"); \quad \{ \text{ make } trie\_char(c) \neq c \text{ for all } c \}
This code is used in section 1020*.
1014.* Now let's go back to the easier problem, of building the linked trie. When INITEX has scanned the
'\patterns' control sequence, it calls on new_patterns to do the right thing.
\langle Declare procedures for preprocessing hyphenation patterns 998* \rangle + \equiv
procedure new_patterns; { initializes the hyphenation pattern data }
  label done, done1;
  var k, l: 0 . . hyphenatable_length_limit + 1;
          { indices into hc and hyf; not always in small\_number range }
     digit_sensed: boolean; { should the next digit be treated as a letter? }
     v: trie_opcode; { trie op code }
     p, q: trie_pointer; { nodes of trie traversed during insertion }
     first\_child: boolean; \{ is p = trie\_l[q]? \}
     c: ASCII_code; { character being inserted }
  begin if trie_not_ready then
     begin set_cur_lang; scan_left_brace; {a left brace must follow \patterns}
     (Enter all of the patterns into a linked trie, until coming to a right brace 1015);
     if saving\_hyph\_codes > 0 then \langle Store hyphenation codes for current language 1667\rangle;
     end
  else begin print_err("Too⊔late⊔for⊔"); print_esc("patterns");
     help1 ("All_patterns_must_be_given_before_typesetting_begins."); error;
     link(garbage) \leftarrow scan\_toks(false, false); flush\_list(def\_ref);
     end;
```

This code is used in section 1017\*.

```
1017* When the following code comes into play, the pattern p_1 \dots p_k appears in hc[1 \dots k], and the
corresponding sequence of numbers n_0 \dots n_k appears in hyf[0 \dots k].
\langle \text{Insert a new pattern into the linked trie } 1017^* \rangle \equiv
  begin (Compute the trie op code, v, and set l \leftarrow 0 1019*);
  q \leftarrow 0; hc[0] \leftarrow cur\_lang;
  while l \leq k do
     begin c \leftarrow hc[l]; incr(l); p \leftarrow trie\_l[q]; first\_child \leftarrow true;
     while (p > 0) \land (c > so(trie\_c[p])) do
        begin q \leftarrow p; p \leftarrow trie\_r[q]; first\_child \leftarrow false;
        end;
     if (p = 0) \lor (c < so(trie\_c[p])) then
        (Insert a new trie node between q and p, and make p point to it 1018*);
     q \leftarrow p; { now node q represents p_1 \dots p_{l-1} }
     end;
  if trie\_o[q] \neq min\_trie\_op then
     begin print_err("Duplicate_pattern"); help1("(See_Appendix,H.)"); error;
   trie\_o[q] \leftarrow v;
  end
This code is used in section 1015.
1018.* (Insert a new trie node between q and p, and make p point to it 1018*) \equiv
  begin if trie_ptr = trie_size then overflow("pattern_memory", trie_size);
  incr(trie\_ptr); trie\_r[trie\_ptr] \leftarrow p; p \leftarrow trie\_ptr; trie\_l[p] \leftarrow 0;
  if first\_child then trie\_l[q] \leftarrow p else trie\_r[q] \leftarrow p;
  trie\_c[p] \leftarrow si(c); trie\_o[p] \leftarrow min\_trie\_op;
This code is used in sections 1017*, 1667, and 1668.
1019* (Compute the trie op code, v, and set l \leftarrow 0 1019*)
  if hc[1] = 0 then hyf[0] \leftarrow 0;
  if hc[k] = 0 then hyf[k] \leftarrow 0;
  l \leftarrow k; \ v \leftarrow min\_trie\_op;
  loop begin if hyf[l] \neq 0 then v \leftarrow new\_trie\_op(k-l, hyf[l], v);
     if l > 0 then decr(l) else goto done1;
     end;
done1:
```

1020\* Finally we put everything together: Here is how the trie gets to its final, efficient form. The following packing routine is rigged so that the root of the linked tree gets mapped into location 1 of *trie*, as required by the hyphenation algorithm. This happens because the first call of *first\_fit* will "take" location 1.

```
⟨ Declare procedures for preprocessing hyphenation patterns 998*⟩ +≡
procedure init_trie;
var p: trie_pointer; { pointer for initialization }
    j, k, t: integer; { all-purpose registers for initialization }
    r, s: trie_pointer; { used to clean up the packed trie }
    begin incr(max_hyph_char); ⟨ Get ready to compress the trie 1006⟩;
    if trie_root ≠ 0 then
        begin first_fit(trie_root); trie_pack(trie_root);
        end;
    if hyph_root ≠ 0 then ⟨ Pack all stored hyph_codes 1669⟩;
    ⟨ Move the data into trie 1012*⟩;
        trie_not_ready ← false;
    end;
```

1042.\* Pages are built by appending nodes to the current list in TeX's vertical mode, which is at the outermost level of the semantic nest. This vlist is split into two parts; the "current page" that we have been talking so much about already, and the "contribution list" that receives new nodes as they are created. The current page contains everything that the page builder has accounted for in its data structures, as described above, while the contribution list contains other things that have been generated by other parts of TeX but have not yet been seen by the page builder. The contribution list starts at link(contrib\_head), and it ends at the current node in TeX's vertical mode.

When TeX has appended new material in vertical mode, it calls the procedure build\_page, which tries to catch up by moving nodes from the contribution list to the current page. This procedure will succeed in its goal of emptying the contribution list, unless a page break is discovered, i.e., unless the current page has grown to the point where the optimum next page break has been determined. In the latter case, the nodes after the optimum break will go back onto the contribution list, and control will effectively pass to the user's output routine.

We make  $type(page\_head) = glue\_node$ , so that an initial glue node on the current page will not be considered a valid breakpoint.

1088\* We leave the  $space_factor$  unchanged if  $sf_code(cur_chr) = 0$ ; otherwise we set it equal to  $sf_code(cur_chr)$ , except that it should never change from a value less than 1000 to a value exceeding 1000. The most common case is  $sf_code(cur_chr) = 1000$ , so we want that case to be fast.

The overall structure of the main loop is presented here. Some program labels are inside the individual sections.

```

 $\S1388$  X<sub>2</sub>T<sub>E</sub>X PART 51: THE MAIN PROGRAM 149

1388\* Here we do whatever is needed to complete T<sub>E</sub>X's job gracefully on the local operating system. The code here might come into play after a fatal error; it must therefore consist entirely of "safe" operations that cannot produce error messages. For example, it would be a mistake to call *str\_room* or *make\_string* at this time, because a call on *overflow* might lead to an infinite loop. (Actually there's one way to get error messages, via *prepare\_mag*; but that can't cause infinite recursion.)

```
If final_cleanup is bypassed, this program doesn't bother to close the input files that may still be open.
```

```
\langle Last-minute procedures 1388* \rangle \equiv

 $\S1393$  X<sub>2</sub>T<sub>E</sub>X PART 52: DEBUGGING 153

1393\* Debugging. Once T<sub>E</sub>X is working, you should be able to diagnose most errors with the \show commands and other diagnostic features. But for the initial stages of debugging, and for the revelation of really deep mysteries, you can compile T<sub>E</sub>X with a few more aids, including the Pascal runtime checks and its debugger. An additional routine called debug\_help will also come into play when you type 'D' after an error message; debug\_help also occurs just before a fatal error causes T<sub>E</sub>X to succumb.

The interface to  $debug\_help$  is primitive, but it is good enough when used with a Pascal debugger that allows you to set breakpoints and to read variables and change their values. After getting the prompt 'debug #', you type either a negative number (this exits  $debug\_help$ ), or zero (this goes to a location where you can set a breakpoint, thereby entering into dialog with the Pascal debugger), or a positive number m followed by an argument n. The meaning of m and n will be clear from the program below. (If m = 13, there is an additional argument, l.)

```
define breakpoint = 888 { place where a breakpoint is desirable }
\langle \text{Last-minute procedures } 1388^* \rangle + \equiv
  debug procedure debug_help; { routine to display various things }
  label breakpoint, exit;
  var k, l, m, n: integer;
  begin clear_terminal;
  loop
     begin wake\_up\_terminal; print\_nl("debug_\psi \psi_\(\sigma\)(-1\psi\(\text{to}\psi\)exit):"); <math>update\_terminal; read(term\_in, m);
     if m < 0 then return
     else if m = 0 then dump\_core
                                         { do something to cause a core dump }
       else begin read(term_in, n);
          case m of
          \langle \text{ Numbered cases for } debug\_help \ 1394* \rangle
          othercases print("?")
          endcases;
          end:
     end:
exit: end:
  gubed
```

This code is used in section 1437\*.

This code is used in section 1347\*.

1452\* The extended features of  $\varepsilon$ -TeX. The program has two modes of operation: (1) In TeX compatibility mode it fully deserves the name TeX and there are neither extended features nor additional primitive commands. There are, however, a few modifications that would be legitimate in any implementation of TeX such as, e.g., preventing inadequate results of the glue to DVI unit conversion during  $ship\_out$ . (2) In extended mode there are additional primitive commands and the extended features of  $\varepsilon$ -TeX are available.

The distinction between these two modes of operation initially takes place when a 'virgin' eINITEX starts without reading a format file. Later on the values of all  $\varepsilon$ -TEX state variables are inherited when eVIRTEX (or eINITEX) reads a format file.

```
The code below is designed to work for cases where 'init ...tini' is a run-time switch.
\langle \text{Enable } \varepsilon\text{-T}_{E}X, \text{ if requested } 1452^* \rangle \equiv

var level: 0.. max_in_open;
begin level ← in_open;
while (level > 0) ∧ (full_source_filename_stack[level] = 0) do decr(level);
if level = 0 then print_nl("!□")
else begin print_nl(""); print(full_source_filename_stack[level]); print(":");
  if level = in_open then print_int(line)
  else print_int(line_stack[level + 1]);
  print(":□");
  end;
end;
```

1685.\* To be able to determine whether \write18 is enabled from within TEX we also implement \eof18. We sort of cheat by having an additional route  $scan\_four\_bit\_int\_or\_18$  which is the same as  $scan\_four\_bit\_int$  except it also accepts the value 18.

```
⟨ Declare procedures that scan restricted classes of integers 467⟩ +≡
procedure scan_four_bit_int_or_18;
begin scan_int;
if (cur_val < 0) ∨ ((cur_val > 15) ∧ (cur_val ≠ 18)) then
begin print_err("Bad_number");
help2("Since_I_expected_to_read_a_number_between_O_and_15,")
("I_changed_this_one_to_zero."); int_error(cur_val); cur_val ← 0;
end;
end;
```

1686\* The string recycling routines. TEX uses 2 upto 4 new strings when scanning a filename in an \input, \openin, or \openout operation. These strings are normally lost because the reference to them are not saved after finishing the operation. search\_string searches through the string pool for the given string and returns either 0 or the found string number.

```
\langle Declare additional routines for string recycling 1686*\rangle \equiv
function search_string(search : str_number): str_number;
  label found;
  var result: str_number; s: str_number; { running index }
     len: integer; { length of searched string }
  begin result \leftarrow 0; len \leftarrow length(search);
  if len = 0 then { trivial case }
     begin result \leftarrow ""; goto found;
     end
  else begin s \leftarrow search - 1; {start search with newest string below s; search > 1!}
     while s > 65535 do { first 64K strings don't really exist in the pool! }
       begin if length(s) = len then
          if str\_eq\_str(s, search) then
            begin result \leftarrow s; goto found;
            end;
       decr(s);
       end;
     end;
found: search\_string \leftarrow result;
  end:
See also section 1687*.
This code is used in section 47^*.
```

1687.\* The following routine is a variant of *make\_string*. It searches the whole string pool for a string equal to the string currently built and returns a found string. Otherwise a new string is created and returned. Be cautious, you can not apply *flush\_string* to a replaced string!

```
⟨ Declare additional routines for string recycling 1686*⟩ +≡ function slow\_make\_string: str\_number; label exit; var s: str\_number; { result of search\_string } t: str\_number; { new string } begin t \leftarrow make\_string; s \leftarrow search\_string(t); if s > 0 then begin flush\_string; slow\_make\_string \leftarrow s; return; end; slow\_make\_string \leftarrow t; exit: end;
```

**1688\*** More changes for Web2c. Sometimes, recursive calls to the *expand* routine may cause exhaustion of the run-time calling stack, resulting in forced execution stops by the operating system. To diminish the chance of this happening, a counter is used to keep track of the recursion depth, in conjunction with a constant called *expand\_depth*.

This does not catch all possible infinite recursion loops, just the ones that exhaust the application calling stack. The actual maximum value of *expand\_depth* is outside of our control, but the initial setting of 10000 should be enough to prevent problems.

```
⟨ Global variables 13⟩ +≡
expand_depth_count: integer;

1689* ⟨ Set initial values of key variables 23*⟩ +≡
expand_depth_count ← 0;
```

1690\* When scan\_file\_name starts it looks for a left\_brace (skipping \relaxes, as other \toks-like primitives). If a left\_brace is found, then the procedure scans a file name contained in a balanced token list, expanding tokens as it goes. When the scanner finds the balanced token list, it is converted into a string and fed character-by-character to more\_name to do its job the same as in the "normal" file name scanning.

```
procedure scan_file_name_braced;
```

```
var save_scanner_status: small_number; { scanner_status upon entry }
  save_def_ref: pointer; { def_ref upon entry, important if inside '\message }
  save_cur_cs: pointer; s: str_number; { temp string }
  p: pointer; { temp pointer }
  i: integer; { loop tally }
  save_stop_at_space: boolean; { this should be in tex.ch }
   dummy: boolean; { Initializing }
\textbf{begin} \ \textit{save\_scanner\_status} \leftarrow \textit{scanner\_status}; \quad \{\textit{scan\_toks} \ \text{sets} \ \textit{scanner\_status} \ \text{to} \ \textit{absorbing} \ \}
save\_def\_ref \leftarrow def\_ref; { scan\_toks uses def\_ref to point to the token list just read }
save\_cur\_cs \leftarrow cur\_cs; { we set cur\_cs back a few tokens to use in runaway errors }
  { Scanning a token list }
cur\_cs \leftarrow warning\_index; { for possible runaway error }
  { mimick call_func from pdfTeX }
if scan\_toks(false, true) \neq 0 then do\_nothing; {actually do the scanning}
     \{s \leftarrow tokens\_to\_string(def\_ref);\}
old\_setting \leftarrow selector; selector \leftarrow new\_string; show\_token\_list(link(def\_ref), null, pool\_size - pool\_ptr);
selector \leftarrow old\_setting; s \leftarrow make\_string; { turns the token list read in a string to input }
  { Restoring some variables }
delete\_token\_ref(def\_ref); { remove the token list from memory }
def\_ref \leftarrow save\_def\_ref; { and restore def\_ref }
cur\_cs \leftarrow save\_cur\_cs; { restore cur\_cs }
scanner\_status \leftarrow save\_scanner\_status;  { restore scanner\_status }
  { Passing the read string to the input machinery }
save\_stop\_at\_space \leftarrow stop\_at\_space; \{ save stop\_at\_space \}
stop\_at\_space \leftarrow false; { set stop\_at\_space to false to allow spaces in file names }
begin\_name;
for i \leftarrow str\_start\_macro(s) to str\_start\_macro(s+1) - 1 do dummy \leftarrow more\_name(str\_pool[i]);
        { add each read character to the current file name }
stop\_at\_space \leftarrow save\_stop\_at\_space;  { restore stop\_at\_space }
end;
```

**1691\*** System-dependent changes for MLT<sub>E</sub>X. The boolean variable *mltex\_p* is set by web2c according to the given command line option (or an entry in the configuration file) before any T<sub>E</sub>X function is called.

```
\langle \text{Global variables } 13 \rangle + \equiv mltex\_p: boolean;
```

1692. The boolean variable  $mltex\_enabled\_p$  is used to enable  $MLT_EX$ 's character substitution. It is initialized to false. When loading a FMT it is set to the value of the boolean  $mltex\_p$  saved in the FMT file. Additionally it is set to the value of  $mltex\_p$  in  $IniT_EX$ .

```
\langle Global variables 13\rangle +\equiv mltex\_enabled\_p: boolean; { enable character substitution } native\_font\_type\_flag: integer; { used by XeTeX font loading code to record which font technology was used } xtx\_ligature\_present: boolean; { to suppress tfm font mapping of char codes from ligature nodes (already mapped) } 1693.* \langle Set initial values of key variables 23*\rangle +\equiv mltex\_enabled\_p \leftarrow false;
```

**1694**\* The function *effective\_char* computes the effective character with respect to font information. The effective character is either the base character part of a character substitution definition, if the character does not exist in the font or the character itself.

Inside effective\_char we can not use char\_info because the macro char\_info uses effective\_char calling this function a second time with the same arguments.

If neither the character c exists in font f nor a character substitution for c was defined, you can not use the function value as a character offset in  $char\_info$  because it will access an undefined or invalid  $font\_info$  entry! Therefore inside  $char\_info$  and in other places,  $effective\_char$ 's boolean parameter  $err\_p$  is set to true to issue a warning and return the incorrect replacement, but always existing character  $font\_bc[f]$ .

```
\langle Declare \varepsilon-T<sub>E</sub>X procedures for scanning 1493\rangle +\equiv
function effective_char(err_p : boolean; f : internal_font_number; c : quarterword): integer;
  label found;
  var base_c: integer; { or eightbits: replacement base character }
     result: integer; { or quarterword }
  begin if (\neg xtx\_ligature\_present) \land (font\_mapping[f] \neq nil) then
     c \leftarrow apply\_tfm\_font\_mapping(font\_mapping[f], c);
  xtx\_ligature\_present \leftarrow false; result \leftarrow c; {return c unless it does not exist in the font}}
  if \neg mltex\_enabled\_p then goto found;
  if font\_ec[f] \ge qo(c) then
     if font\_bc[f] \leq qo(c) then
       if char\_exists(orig\_char\_info(f)(c)) then { N.B.: not char\_info(f)(c) }
          goto found;
  if qo(c) > char\_sub\_def\_min then
     if qo(c) \leq char\_sub\_def\_max then
       if char\_list\_exists(qo(c)) then
          begin base\_c \leftarrow char\_list\_char(qo(c)); result \leftarrow qi(base\_c); \{return base\_c \}
          if \neg err\_p then goto found;
          if font\_ec[f] \geq base\_c then
             if font_bc[f] \leq base_c then
               if char\_exists(orig\_char\_info(f)(qi(base\_c))) then goto found;
          end:
  if err_p then { print error and return existing character? }
     begin begin_diagnostic; print_nl("Missing_character: _There_is_no_");
     print("substitution_{\square}for_{\square}"); print_ASCII(qo(c)); print("_{\square}in_{\square}font_{\square}"); slow_print(font_name[f]);
     print\_char("!"); end\_diagnostic(false); result \leftarrow qi(font\_bc[f]);
          \{ N.B.: not non-existing character c! \}
     end:
found: effective\_char \leftarrow result;
  end;
```

1695\* The function  $effective\_char\_info$  is equivalent to  $char\_info$ , except it will return  $null\_character$  if neither the character c exists in font f nor is there a substitution definition for c. (For these cases  $char\_info$  using  $effective\_char$  will access an undefined or invalid  $font\_info$  entry. See the documentation of  $effective\_char$  for more information.)

```
\langle Declare additional functions for MLT<sub>E</sub>X _{1695*}\rangle \equiv
function effective_char_info(f: internal_font_number; c: quarterword): four_quarters;

  begin if (\neg xtx\_ligature\_present) \land (font\_mapping[f] \neq nil) then
     c \leftarrow apply\_tfm\_font\_mapping(font\_mapping[f], c);
  xtx\_ligature\_present \leftarrow false;
  if \neg mltex\_enabled\_p then
     begin effective_char_info \leftarrow orig_char_info(f)(c); return;
     end;
  if font_{-}ec[f] \geq qo(c) then
     if font\_bc[f] \leq qo(c) then
        begin ci \leftarrow orig\_char\_info(f)(c); \{ N.B.: not char\_info(f)(c) \}
        if char\_exists(ci) then
          begin effective_char_info \leftarrow ci; return;
          end;
        end;
  if qo(c) > char\_sub\_def\_min then
     if qo(c) \leq char\_sub\_def\_max then
       if char\_list\_exists(qo(c)) then
                     \{effective\_char\_info \leftarrow char\_info(f)(qi(char\_list\_char(qo(c))));\}
          base\_c \leftarrow char\_list\_char(qo(c));
          if font\_ec[f] \ge base\_c then
             if font\_bc[f] \leq base\_c then
                begin ci \leftarrow orig\_char\_info(f)(qi(base\_c)); \{ N.B.: not char\_info(f)(c) \}
                if char_exists(ci) then
                  begin effective_char_info \leftarrow ci; return;
                  end;
                end;
          end:
   effective\_char\_info \leftarrow null\_character;
exit: end;
   (Declare subroutines for new_character 616*)
This code is used in section 595*.
```

1696.\* This code is called for a virtual character c in  $hlist\_out$  during  $ship\_out$ . It tries to built a character substitution construct for c generating appropriate DVI code using the character substitution definition for this character. If a valid character substitution exists DVI code is created as if  $make\_accent$  was used. In all other cases the status of the substitution for this character has been changed between the creation of the character node in the hlist and the output of the page—the created DVI code will be correct but the visual result will be undefined.

Former MLTEX versions have replaced the character node by a sequence of character, box, and accent kern nodes splicing them into the original horizontal list. This version does not do this to avoid a) a memory overflow at this processing stage, b) additional code to add a pointer to the previous node needed for the replacement, and c) to avoid wrong code resulting in anomalies because of the use within a \leaders box.

```
⟨ Output a substitution, goto continue if not possible 1696*⟩ ≡
begin ⟨ Get substitution information, check it, goto found if all is ok, otherwise goto continue 1698*⟩;
found: ⟨ Print character substitution tracing log 1699*⟩;
⟨ Rebuild character using substitution information 1700*⟩;
end
```

This code is used in section 658\*.

1697.\* The global variables for the code to substitute a virtual character can be declared as local. Nonetheless we declare them as global to avoid stack overflows because *hlist\_out* can be called recursively.

```
 \langle \text{Global variables } 13 \rangle +\equiv \\ accent\_c, base\_c, replace\_c: integer; \\ ia\_c, ib\_c: four\_quarters; & \{ \text{accent and base character information } \} \\ base\_slant, accent\_slant: real; & \{ \text{amount of slant } \} \\ base\_x\_height: scaled; & \{ \text{accent is designed for characters of this height } \} \\ base\_width, base\_height: scaled; & \{ \text{height and width for base character } \} \\ accent\_width, accent\_height: scaled; & \{ \text{height and width for accent } \} \\ delta: scaled; & \{ \text{amount of right shift } \}
```

XaTeX

1698\* Get the character substitution information in *char\_sub\_code* for the character *c*. The current code checks that the substitution exists and is valid and all substitution characters exist in the font, so we can *not* substitute a character used in a substitution. This simplifies the code because we have not to check for cycles in all character substitution definitions.

```
\langle Get substitution information, check it, goto found if all is ok, otherwise goto continue 1698*\rangle \equiv
  if qo(c) \ge char\_sub\_def\_min then
     if qo(c) \leq char\_sub\_def\_max then
       if char\_list\_exists(qo(c)) then
          begin base\_c \leftarrow char\_list\_char(qo(c)); \ accent\_c \leftarrow char\_list\_accent(qo(c));
          if (font\_ec[f] \geq base\_c) then
            if (font\_bc[f] \leq base\_c) then
               if (font\_ec[f] \ge accent\_c) then
                 if (font\_bc[f] \leq accent\_c) then
                    begin ia\_c \leftarrow char\_info(f)(qi(accent\_c)); ib\_c \leftarrow char\_info(f)(qi(base\_c));
                   if char\_exists(ib\_c) then
                      if char_{-}exists(ia_{-}c) then goto found;
                    end;
          begin\_diagnostic; print\_nl("Missing\_character:\_Incomplete\_substitution\_");
          print\_ASCII(qo(c)); print(" = "); print\_ASCII(accent\_c); print(" = "); print\_ASCII(base\_c);
          print("⊔in⊔font⊔"); slow_print(font_name[f]); print_char("!"); end_diagnostic(false);

     slow_print(font_name[f]); print_char("."); end_diagnostic(false);
     end
This code is used in section 1696*.
```

1700.\* This outputs the accent and the base character given in the substitution. It uses code virtually identical to the *make\_accent* procedure, but without the node creation steps.

Additionally if the accent character has to be shifted vertically it does *not* create the same code. The original routine in  $make\_accent$  and former versions of MLTEX creates a box node resulting in push and pop operations, whereas this code simply produces vertical positioning operations. This can influence the pixel rounding algorithm in some DVI drivers—and therefore will probably be changed in one of the next MLTEX versions.

```
\langle Rebuild character using substitution information 1700^*\rangle \equiv

1703\* The Synchronize TeXnology. This section is devoted to the Synchronize TeXnology - or simply SyncTeX - used to synchronize between input and output. This section explains how synchronization basics are implemented. Before we enter into more technical details, let us recall in a few words what is synchronization.

TEX typesetting system clearly separates the input and the output material, and synchronization will provide a new link between both that can help text editors and viewers to work together. More precisely, forwards synchronization is the ability, given a location in the input source file, to find what is the corresponding place in the output. Backwards synchronization just performs the opposite: given a location in the output, retrieve the corresponding material in the input source file.

For better code management and maintainance, we adopt a naming convention. Throughout this program, code related to the *Synchronize TeXnology* is tagged with the "synctex" key word. Any code extract where *SyncTeX* plays its part, either explicitly or implicitly, (should) contain the string "synctex". This naming convention also holds for external files. Moreover, all the code related to *SyncTeX* is gathered in this section, except the definitions.

1704.\* Enabling synchronization should be performed from the command line, synctexoption is used for that purpose. This global integer variable is declared here but it is not used here. This is just a placeholder where the command line controller will put the  $SyncT_EX$  related options, and the  $SyncT_EX$  controller will read them.

```
1705.* \langle Global variables 13 \rangle + \equiv synctexoption: integer;
```

1706.\* A convenient primitive is provided: \synctex=1 in the input source file enables synchronization whereas \synctex=0 disables it. Its memory address is synctex\_code. It is initialized by the SyncTeX controller to the command-line option if given. The controller may filter some reserved bits.

```
1707.* ⟨Put each of TEX's primitives into the hash table 252⟩ += primitive("synctex", assign_int, int_base + synctex_code);
1708.* ⟨synctex case for print_param 1708*⟩ = synctex_code: print_esc("synctex");
This code is used in section 263*.
```

1709.\* In order to give the SyncTeX controller read and write access to the contents of the \synctex primitive, we declare synctexoffset, such that mem[synctexoffset] and \synctex correspond to the same memory storage. synctexoffset is initialized to the correct value when quite everything is initialized.

```
1710* ⟨Global variables 13⟩ +≡
synctexoffset: integer; {holds the true value of synctex_code}
1711* ⟨Initialize whatever TEX might access 8*⟩ +≡
synctexoffset ← int_base + synctex_code;
1712* ⟨Initialize synctex primitive 1712*⟩ ≡
synctex_init_command;
This code is used in section 1387*.
```

1713\* Synchronization is achieved with the help of an auxiliary file named 'jobname.synctex' (jobname is the contents of the \jobname macro), where a SyncTEX controller implemented in the external synctex.c file will store geometrical information. This SyncTEX controller will take care of every technical details concerning the SyncTEX file, we will only focus on the messages the controller will receive from the TEX program.

The most accurate synchronization information should allow to map any character of the input source file to the corresponding location in the output, if relevant. Ideally, the synchronization information of the input material consists of the file name, the line and column numbers of every character. The synchronization information in the output is simply the page number and either point coordinates, or box dimensions and position. The problem is that the mapping between these informations is only known at ship out time, which means that we must keep track of the input synchronization information until the pages ship out.

As T<sub>E</sub>X only knows about file names and line numbers, but forgets the column numbers, we only consider a restricted input synchronization information called *SyncT<sub>E</sub>X information*. It consists of a unique file name identifier, the *SyncT<sub>E</sub>X* file tag, and the line number.

Keeping track of such information, should be different whether characters or nodes are involved. Actually, only certain nodes are involved in  $SyncT_EX$ , we call them synchronized nodes. Synchronized nodes store the  $SyncT_EX$  information in their last two words: the first one contains a  $SyncT_EX$  file tag uniquely identifying the input file, and the second one contains the current line number, as returned by the \inputlineno primitive. The  $synctex\_field\_size$  macro contains the necessary size to store the  $SyncT_EX$  information in a node.

When declaring the size of a new node, it is recommanded to use the following convention: if the node is synchronized, use a definition similar to  $my\_synchronized\_node\_size=xxx+synctex\_field\_size$ . Moreover, one should expect that the  $SyncT_FX$  information is always stored in the last two words of a synchronized node.

1714\* By default, every node with a sufficiently big size is initialized at creation time in the <code>get\_node</code> routine with the current <code>SyncTeX</code> information, whether or not the node is synchronized. One purpose is to set this information very early in order to minimize code dependencies, including forthcoming extensions. Another purpose is to avoid the assumption that every node type has a dedicated getter, where initialization should take place. Actually, it appears that some nodes are created using directly the <code>get\_node</code> routine and not the dedicated constructor. And finally, initializing the node at only one place is less error prone.

```
1715* \langle Initialize bigger nodes with SyncT_EX information 1715*\rangle \equiv if s \geq medium\_node\_size then begin sync\_tag(r+s) \leftarrow synctex\_tag; sync\_line(r+s) \leftarrow line; end;
This code is used in section 147*.
```

1716.\* Instead of storing the input file name, it is better to store just an identifier. Each time TEX opens a new file, it notifies the SyncTEX controller with a  $synctex\_start\_input$  message. This controller will create a new SyncTEX file tag and will update the current input state record accordingly. If the input comes from the terminal or a pseudo file, the  $synctex\_tag$  is set to 0. It results in automatically disabling synchronization for material input from the terminal or pseudo files.

```
1717* ⟨Prepare new file SyncTEX information 1717*⟩ ≡ synctex_start_input; {Give control to the SyncTEX controller}
This code is used in section 572*.
1718* ⟨Prepare terminal input SyncTEX information 1718*⟩ ≡ synctex_tag ← 0;
This code is used in section 358*.
```

```
1719* ⟨Prepare pseudo file SyncT<sub>E</sub>X information 1719*⟩ ≡ synctex_tag ← 0;
This code is used in section 1567*.
1720* ⟨Close SyncT<sub>E</sub>X file and write status 1720*⟩ ≡ synctex_terminate(log_opened); {Let the SyncT<sub>E</sub>X controller close its files.}
This code is used in section 1388*.
```

1721.\* Synchronized nodes are boxes, math, kern and glue nodes. Other nodes should be synchronized too, in particular math noads. TeX assumes that math, kern and glue nodes have the same size, this is why both are synchronized. In fine, only horizontal lists are really used in SyncTeX, but all box nodes are considered the same with respect to synchronization, because a box node type is allowed to change at execution time.

The next sections are the various messages sent to the  $SyncT_EX$  controller. The argument is either the box or the node currently shipped out. The vertical boxes are not recorded, but the code is available for clients.

```
1722* \langle \text{Start sheet } SyncT_{EX} \text{ information record } 1722* \rangle \equiv
   synctex\_sheet(mag);
This code is used in section 676*.
1723* (Finish sheet SyncT_{FX} information record 1723*) \equiv
   synctex\_teehs;
This code is used in section 676*.
1724* \langle \text{Start vlist } SyncT_{FX} \text{ information record } 1724* \rangle \equiv
   synctex\_vlist(this\_box);
This code is used in section 667*.
1725* \langle \text{Finish vlist } SyncT_{FX} \text{ information record } 1725* \rangle \equiv
   synctex\_tsilv(this\_box);
This code is used in section 667*.
1726* \langle \text{Start hlist } SyncT_{FX} \text{ information record } 1726* \rangle \equiv
   synctex\_hlist(this\_box);
This code is used in section 655*.
1727* (Finish hlist SyncT_{FX} information record 1727^*) \equiv
   synctex\_tsilh(this\_box);
This code is used in section 655*.
1728* \langle \text{Record void list } SyncT_{FX} \text{ information } 1728* \rangle \equiv
  if type(p) = vlist\_node then
      begin synctex\_void\_vlist(p, this\_box);
      end
   else begin synctex\_void\_hlist(p, this\_box);
      end;
This code is used in sections 661^* and 670^*.
1729* \langle \text{Record current point } SyncT_{FX} \text{ information } 1729* \rangle \equiv
   synctex\_current;
This code is used in section 658*.
```

```
1730* ⟨ Record horizontal rule_node or glue_node SyncTeX information 1730*⟩ ≡ synctex_horizontal_rule_or_glue(p, this_box);
This code is used in section 660*.
1731* ⟨ Record kern_node SyncTeX information 1731*⟩ ≡ synctex_kern(p, this_box);
This code is used in section 660*.
1732* ⟨ Record math_node SyncTeX information 1732*⟩ ≡ synctex_math(p, this_box);
This code is used in section 660*.
```

1733\* When making a copy of a synchronized node, we might also have to duplicate the  $SyncT_EX$  information by copying the two last words. This is the case for a  $box\_node$  and for a  $glue\_node$ , but not for a  $math\_node$  nor a  $kern\_node$ . These last two nodes always keep the  $SyncT_EX$  information they received at creation time.

1737\* Nota Bene: The SyncTeX code is very close to the memory model. It is not connected to any other part of the code, except for memory management. It is possible to neutralize the SyncTeX code rather simply. The first step is to define a null synctex\_field\_size. The second step is to comment out the code in "Initialize bigger nodes..." and every "Copy ... SyncTeX information". The last step will be to comment out the synctex\_tag\_field related code in the definition of synctex\_tag and the various "Prepare ... SyncTeX information". Then all the remaining code should be just harmless. The resulting program would behave exactly the same as if absolutely no SyncTeX related code was there, including memory management. Of course, all this assumes that SyncTeX is turned off from the command line.

## 1738\* System-dependent changes.

```

     end;
  end;
        This function used to be in pdftex, but is useful in tex too.
function get_nullstr: str_number;
  begin get_nullstr \leftarrow "";
  end:
```

182 PART 55: INDEX X<sub>H</sub>T<sub>E</sub>X §1740

1740\* Index. Here is where you can find all uses of each identifier in the program, with underlined entries pointing to where the identifier was defined. If the identifier is only one letter long, however, you get to see only the underlined entries. All references are to section numbers instead of page numbers.

This index also lists error messages and other aspects of the program that you might want to look up some day. For example, the entry for "system dependencies" lists all sections that should receive special attention from people who are installing T<sub>E</sub>X in a new operating environment. A list of various things that can't happen appears under "this can't happen". Approximately 40 sections are listed under "inner loop"; these account for about 60% of T<sub>E</sub>X's running time, exclusive of input and output.

```
The following sections were changed by the change file: 2, 4, 6, 7, 8, 11, 12, 16, 19, 20, 23, 24, 26, 27, 28, 30, 31, 32, 33, 34, 35,

(Accumulate the constant until cur_tok is not a suitable digit 479)
                                                                            Used in section 478.
\langle Add the width of node s to act\_width 919 \rangle Used in section 917.
\langle Add the width of node s to break_width 890\rangle Used in section 888.
\langle Add the width of node s to disc\_width 918 \rangle Used in section 917.
(Adjust for the magnification ratio 492) Used in section 488.
(Adjust for the setting of \globaldefs 1268) Used in section 1265.
\langle \text{Adjust } shift\_up \text{ and } shift\_down \text{ for the case of a fraction line } 790 \rangle Used in section 787.
\langle Adjust \, shift\_up \, and \, shift\_down \, for the case of no fraction line 789 \rangle Used in section 787.
(Adjust the LR stack for the hlist_out routine; if necessary reverse an hlist segment and goto reswitch 1528)
    Used in section 1527.
\langle Adjust the LR stack for the hpack routine 1522\rangle Used in section 691.
(Adjust the LR stack for the init_math routine 1549) Used in section 1548.
\langle \text{Adjust the LR stack for the } just\_reverse \text{ routine } 1551^* \rangle Used in section 1550*.
(Adjust the LR stack for the post_line_break routine 1519) Used in sections 927, 929, and 1518.
(Adjust the additional data for last line 1661) Used in section 899.
 Adjust the final line of the paragraph 1665 \ Used in section 911.
\langle \text{Adjust } selector \text{ based on } show\_stream 1348* \rangle Used in sections 1347*, 1349*, 1351*, 1352*, 1488*, and 1502*.
\langle Advance cur_p to the node following the present string of characters 915\rangle Used in section 914.
(Advance past a whatsit node in the line_break loop 1423) Used in section 914.
(Advance past a whatsit node in the pre-hyphenation loop 1424) Used in section 949.
\langle Advance r; goto found if the parameter delimiter has been fully matched, otherwise goto continue 428\rangle
    Used in section 426.
\langle Advance q past ignorable nodes 657\rangle Used in sections 656, 656, and 656.
\langle Allocate entire node p and goto found 151\rangle Used in section 149.
\langle Allocate from the top of node p and goto found 150\rangle Used in section 149.
(Apologize for inability to do the operation now, unless \unskip follows non-glue 1160) Used in section 1159.
(Apologize for not loading the font, goto done 602) Used in sections 601 and 744.
Append a ligature and/or kern to the translation; goto continue if the stack of inserted ligatures is
    nonempty 964* Used in section 960.
\langle Append a new leader node that uses cur\_box 1132 \rangle Used in section 1129.
(Append a new letter or a hyphen level 1016) Used in section 1015.
(Append a new letter or hyphen 991) Used in section 989.
(Append a normal inter-word space to the current list, then goto biq_switch 1095) Used in section 1084.
Append a penalty node, if a nonzero penalty is appropriate 938 Used in section 928.
(Append an insertion to the current page and goto contribute 1062) Used in section 1054.
\langle Append any new_hlist entries for q, and any appropriate penalties 815\rangle Used in section 808.
\langle Append box cur\_box to the current list, shifted by box\_context 1130 \rangle Used in section 1129.
\langle Append character cur_chr and the following characters (if any) to the current hlist in the current font;
    goto reswitch when a non-character has been fetched 1088*) Used in section 1084.
\langle Append characters of hu[j..] to major\_tail, advancing j 971\rangle Used in section 970.
\langle Append inter-element spacing based on r_{type} and t 814\rangle Used in section 808.
\langle Append tabskip glue and an empty box to list u, and update s and t as the prototype nodes are passed 857\rangle
    Used in section 856.
\langle Append the accent with appropriate kerns, then set p \leftarrow q \mid 1179 \rangle Used in section 1177.
(Append the current tabskip glue to the preamble list 826) Used in section 825.
(Append the display and perhaps also the equation number 1258)
                                                                          Used in section 1253.
(Append the glue or equation number following the display 1259) Used in section 1253.
(Append the glue or equation number preceding the display 1257) Used in section 1253.
Append the new box to the current vertical list, followed by the list of special nodes taken out of the box
    by the packager 936 V Used in section 928.
\langle Append the value n to list p 992\rangle Used in section 991.
```

```
\langle Assign the values depth\_threshold \leftarrow show\_box\_depth and breadth\_max \leftarrow show\_box\_breadth 262*\rangle
    section 224.
Assignments 1271, 1272, 1275, 1278*, 1279, 1280, 1282, 1286, 1288, 1289, 1295, 1296, 1302, 1306*, 1307, 1310, 1318
    Used in section 1265.
\langle Attach list p to the current list, and record its length; then finish up and return 1174\rangle Used in section 1173.
 Attach subscript OpenType math kerning 806 \ Used in sections 801 and 803.
 Attach superscript OpenType math kerning 807 \ Used in sections 802 and 803.
 Attach the limits to y and adjust height(v), depth(v) to account for their presence 795 \( \) Used in section 794.
 Back up an outer control sequence so that it can be reread 367 \ Used in section 366.
 Basic printing procedures 57, 58, 59, 63, 66*, 67, 68, 69, 292*, 293, 553*, 741, 1416, 1634, 1682*, 1684*
Break the current page at node p, put it in box 255, and put the remaining nodes on the contribution
    list 1071 V Used in section 1068.
Break the paragraph at the chosen breakpoints, justify the resulting lines to the correct widths, and
    append them to the current vertical list 924 \ Used in section 863.
(Calculate page dimensions and margins 1429) Used in section 653*.
\langle Calculate the length, l, and the shift amount, s, of the display lines 1203\rangle Used in section 1199.
(Calculate the natural width, w, by which the characters of the final line extend to the right of the reference
    point, plus two ems; or set w \leftarrow max\_dimen if the non-blank information on that line is affected by
    stretching or shrinking 1200 \ Used in section 1199.
\langle Call the packaging subroutine, setting just\_box to the justified box 937\rangle Used in section 928.
(Call try_break if cur_p is a legal breakpoint; on the second pass, also try to hyphenate the next word, if
     cur_p is a glue node; then advance cur_p to the next node of the paragraph that could possibly be a
    legal breakpoint 914 \rangle Used in section 911.
(Carry out a ligature replacement, updating the cursor structure and possibly advancing j; goto continue
    if the cursor doesn't advance, otherwise goto done 965 Used in section 963.
\langle Case statement to copy different types and set words to the number of initial words not yet copied 232*\rangle
    Used in section 231.
 Cases for 'Fetch the dead\_cycles or the insert\_penalties' 1505 \ Used in section 453.
 Cases for evaluation of the current term 1603, 1607, 1608, 1610 Used in section 1595.
 Cases for fetching a dimension value 1459, 1482, 1485, 1616 Used in section 458.
 Cases for fetching a glue value 1619 Used in section 1592.
 Cases for fetching a mu value 1620 Vsed in section 1592.
 Cases for fetching an integer value 1455, 1476, 1479, 1615 Used in section 458.
 Cases for noads that can follow a bin\_noad 776 \ Used in section 771.
 Cases for nodes that can appear in an mlist, after which we goto done_with_node 773 Used in section 771.
 Cases for alter\_integer\ 1507 \rangle Used in section 1300.
 Cases for conditional 1578, 1579, 1581 \rangle Used in section 536*.
 Cases for do\_marks 1638, 1640, 1641, 1643 \rightarrow Used in section 1637.
 Cases for eq\_destroy 1646 \rightarrow Used in section 305.
 Cases for input 1561 Used in section 412.
 Cases for print_param 1470, 1511 Used in section 263*.
 Cases for show\_whatever\ 1488^*, 1502^* Used in section 1347^*.
 Cases of 'Let d be the natural width' that need special treatment 1548 \) Used in section 1201.
 Cases of 'Print the result of command c' 1462 \ Used in section 507.
 Cases of 'Scan the argument for command c' 1461 \ Used in section 506.
 Cases of assign\_toks for print\_cmd\_chr 1469 \rangle Used in section 257.
 Cases of convert for print\_cmd\_chr 1460 \ Used in section 504.
 Cases of expandafter for print_cmd_chr 1575 \ Used in section 296*.
 Cases of flush\_node\_list that arise in mlists only 740 \rangle Used in section 228*.
 Cases of handle_right_brace where a right_brace triggers a delayed action 1139*, 1154*, 1172, 1186, 1187*, 1222*,
    1227, 1240 Used in section 1122.
```

```
(Cases of hlist_out that arise in mixed direction text only 1531)
                                                                        Used in section 660*.
 Cases of if\_test for print\_cmd\_chr 1576 \ Used in section 523.
 Cases of input for print\_cmd\_chr 1560 \ Used in section 411.
 Cases of last\_item for print\_cmd\_chr 1454, 1475, 1478, 1481, 1484, 1591, 1614, 1618 \rangle Used in section 451.
 Cases of left\_right for print\_cmd\_chr 1509 \rightarrow Used in section 1243.
 Cases of main\_control for hmode + valign 1514 Used in section 1184*.
 Cases of main_control that are for extensions to T<sub>F</sub>X 1403 \rangle Used in section 1099.
 Cases of main\_control that are not part of the inner loop 1099 \quad Used in section 1084.
 Cases of main_control that build boxes and lists 1110, 1111, 1117, 1121, 1127, 1144, 1146, 1148, 1151, 1156, 1158,
    1163, 1166, 1170, 1176, 1180, 1184^*, 1188, 1191, 1194, 1204, 1208, 1212, 1216, 1218, 1221^*, 1225, 1229, 1234, 1244, 1247
    Used in section 1099.
\langle \text{Cases of } main\_control \text{ that don't depend on } mode 1264, 1322, 1325^*, 1328, 1330, 1339, 1344 \rangle Used in section 1099.
 Cases of prefix for print\_cmd\_chr 1583 \ Used in section 1263.
Cases of print_cmd_chr for symbolic printing of primitives 253, 257, 265, 275, 296*, 365, 411, 419, 446, 451, 504,
    523, 527, 829, 1038, 1107, 1113, 1126, 1143, 1162, 1169, 1197, 1211, 1224, 1233, 1243, 1263, 1274, 1277*, 1285, 1305,
    1309, 1315, 1317, 1327, 1332, 1341, 1346, 1350, 1402 Used in section 328.
\langle \text{ Cases of } read \text{ for } print\_cmd\_chr \text{ 1572} \rangle Used in section 296*.
 Cases of register for print_cmd_chr 1644 \ Used in section 446.
 Cases of reverse that need special treatment 1537, 1538, 1539, 1540 Used in section 1536*.
 Cases of set\_page\_int for print\_cmd\_chr 1504 \rightarrow Used in section 451.
 Cases of set\_shape for print\_cmd\_chr 1677 \rightarrow Used in section 296*.
 Cases of show\_node\_list that arise in mlists only 732 \ Used in section 209.
 Cases of the for print\_cmd\_chr 1498 \rightarrow Used in section 296*.
 Cases of toks\_register for print\_cmd\_chr 1645 \rightarrow Used in section 296*.
 Cases of un\_vbox for print\_cmd\_chr 1674 \rightarrow Used in section 1162.
 Cases of valign for print\_cmd\_chr 1513 \ Used in section 296*.
 Cases of xray for print\_cmd\_chr 1487, 1496, 1501 \rightarrow Used in section 1346.
 Cases where character is ignored 375 Used in section 374.
 Change buffered instruction to y or w and goto found 649 \ Used in section 648.
 Change buffered instruction to z or x and goto found 650 Used in section 648.
 Change current mode to -vmode for \halign, -hmode for \valign 823 \rangle Used in section 822.
 Change discretionary to compulsory and set disc\_break \leftarrow true 930 \ Used in section 929.
 Change font dvi_f to f 659* Used in sections 658*, 1427, and 1431.
 Change state if necessary, and goto switch if the current character should be ignored, or goto reswitch if
    the current character changes to another 374 \rangle Used in section 373.
Change the case of the token in p, if a change is appropriate 1343 \ Used in section 1342.
 Change the current style and goto delete_q 811 \) Used in section 809.
 Change the interaction level and return 90 \ Used in section 88*.
(Change this node to a style node followed by the correct choice, then goto done_with_node 774) Used in
    section 773.
\langle Character s is the current new-line character 270\rangle Used in sections 59 and 63.
 Check flags of unavailable nodes 195 Used in section 192.
 Check for LR anomalies at the end of hlist_out 1529 Used in section 1526.
 Check for LR anomalies at the end of hpack | 1523 \rangle Used in section 689.
 Check for LR anomalies at the end of ship\_out\ 1542 \ Used in section 676*.
 Check for charlist cycle 605^* Used in section 604.
 Check for improper alignment in displayed math 824 \ Used in section 822.
 Check for special treatment of last line of paragraph 1655 \ Used in section 875.
 Check if node p is a new champion breakpoint; then goto done if p is a forced break or if the page-so-far
    is already too full 1028 Used in section 1026.
Check if node p is a new champion breakpoint; then if it is time for a page break, prepare for output, and
```

either fire up the user's output routine and **return** or ship out the page and **goto** done 1059 Used in

 $\langle \text{ Constants in the outer block } 11^* \rangle$  Used in section  $4^*$ .

```
section 1051.
\langle Check single-word avail list 193\rangle Used in section 192.
 Check that another $ follows 1251 \rangle Used in sections 1248, 1248, and 1260.
 Check that nodes after native_word permit hyphenation; if not, goto done1 945 \> Used in section 943.
 Check that the necessary fonts for math symbols are present; if not, flush the current math lists and set
    danger \leftarrow true \ 1249 Used in sections 1248 and 1248.
Check that the nodes following hb permit hyphenation and that at least l_-hyf + r_-hyf letters have been
    found, otherwise goto done1 952 \ Used in section 943.
 Check the "constant" values for consistency 14, 133*, 320*, 557, 1303 \ Used in section 1387*.
 Check variable-size avail list 194 \ Used in section 192.
 Clean up the memory by removing the break nodes 913 Used in sections 863 and 911.
 Clear dimensions to zero 690 \ Used in sections 689 and 710.
 Clear off top level from save\_stack 312 \ Used in section 311.
 Close the format file 1384 Vsed in section 1357^*.
 Close SyncT_{FX} file and write status 1720^* Used in section 1388*.
 Coerce glue to a dimension 486 \ Used in sections 484 and 490.
 Compiler directives 9 \ Used in section 4^*.
 Complain about an undefined family and set cur_i null 766
                                                                   Used in section 765*.
 Complain about an undefined macro 404 \ Used in section 399.
 Complain about missing \endcsname 407 \ Used in sections 406 and 1579.
 Complain about unknown unit and goto done 2 494 Used in section 493.
 Complain that \the can't do this; give zero result 462 \times Used in section 447.
 Complain that the user should have said \mathaccent 1220 \tag{ Used in section 1219.
 Compleat the incompleat noad 1239 Used in section 1238.
 Complete a potentially long \show command 1353 \) Used in section 1347*.
 Compute f = \lfloor 2^{28}(1+p/q) + \frac{1}{2} \rfloor 117 Used in section 116.
Compute p = \lfloor qf/2^{28} + \frac{1}{2} \rfloor - q 120 \ Used in section 118.
 Compute f = |xn/d + \frac{1}{2}|^2 1612 Used in section 1611.
 Compute result of multiply or divide, put it in cur_val 1294 Used in section 1290.
 Compute result of register or advance, put it in cur_val 1292 \rangle Used in section 1290.
 Compute the amount of skew 785 Used in section 781.
 Compute the badness, b, of the current page, using awful_{-}bad if the box is too full 1061 \ Used in section 1059.
 Compute the badness, b, using awful_{-}bad if the box is too full 1029 \ Used in section 1028.
 Compute the demerits, d, from r to cur_p 907 Used in section 903.
 Compute the discretionary break_width values 888 \ Used in section 885.
 Compute the hash code h 288 \ Used in section 286.
 Compute the magic offset 813 \ Used in section 1392^*.
 Compute the mark pointer for mark type t and class cur_val 1636 \ Used in section 420.
\langle Compute the minimum suitable height, w, and the corresponding number of extension steps, n; also set
    width(b) 757 \ Used in section 756.
 Compute the new line width 898 \ Used in section 883.
 Compute the primitive code h 291 \times Used in section 289.
 Compute the register location l and its type p; but return if invalid 1291 \( \rightarrow \) Used in section 1290.
 Compute the sum of two glue specs 1293 \ Used in section 1292.
 Compute the sum or difference of two glue specs 1606 \> Used in section 1604.
 Compute the trie op code, v, and set l \leftarrow 0 1019* Used in section 1017*.
 Compute the values of break\_width 885 Used in section 884.
 Consider a node with matching width; goto found if it's a hit 648 \ Used in section 647.
Consider the demerits for a line from r to cur_p; deactivate node r if it should no longer be active; then
    goto continue if a line from r to cur_p is infeasible, otherwise record a new feasible break 899 \( \) Used
    in section 877.
```

```
(Construct a box with limits above and below it, skewed by delta 794) Used in section 793*.
 Construct a sub/superscript combination box x, with the superscript offset by delta 803 Used in section 800.
 Construct a subscript box x when there is no superscript 801 Used in section 800.
 Construct a superscript box x 802 Used in section 800.
 Construct a vlist box for the fraction, according to shift_up and shift_down 791 \ Used in section 787.
 Construct an extensible character in a new box b, using recipe rem_b yte(q) and font f 756 \text{ Used in
    section 753.
(Contribute an entire group to the current parameter 433) Used in section 426.
(Contribute the recently matched tokens to the current parameter, and goto continue if a partial match is
    still in effect; but abort if s = null | 431 \rangle Used in section 426.
\langle \text{Convert a final } bin\_noad \text{ to an } ord\_noad \text{ 772} \rangle Used in sections 769 and 771.
 Convert cur_val to a lower level 463 \ Used in section 447.
 Convert math glue to ordinary glue 775 \ Used in section 773.
 Convert nucleus(q) to an hlist and attach the sub/superscripts 798 \( \) Used in section 771.
 Convert string s into a new pseudo file 1566 V Used in section 1565.
 Copy the box SyncT_{FX} information 1734* Used in sections 232* and 1545*.
 Copy the medium sized node SyncT_{FX} information 1736* Used in sections 232* and 1545*.
 Copy the rule SyncT_{EX} information 1735* Used in section 232*.
 Copy the tabskip glue between columns 843 \ Used in section 839.
 Copy the templates from node cur\_loop into node p 842 \quad Used in section 841.
 Copy the token list 501 Vsed in section 500.
 Create a character node p for nucleus(q), possibly followed by a kern node for the italic correction, and set
    delta to the italic correction if a subscript is present 799 \quad Used in section 798.
\langle Create a character node q for the next character, but set q \leftarrow null if problems arise 1178\rangle Used in
    section 1177.
\langle Create a new array element of type t with index i 1632 \rangle Used in section 1631.
(Create a new glue specification whose width is cur_val; scan for its stretch and shrink components 497)
    Used in section 496.
Create a page insertion node with subtype(r) = qi(n), and include the glue correction for box n in the
    current page state 1063 \ Used in section 1062.
(Create an active breakpoint representing the beginning of the paragraph 912) Used in section 911.
(Create and append a discretionary node as an alternative to the unhyphenated word, and continue to
    develop both branches until they become equivalent 968 \rangle Used in section 967.
\langle Create equal-width boxes x and z for the numerator and denominator, and compute the default amounts
    shift_up and shift_down by which they are displaced from the baseline 788 \ Used in section 787.
(Create new active nodes for the best feasible breaks just found 884) Used in section 883.
(Create the format_ident, open the format file, and inform the user that dumping has begun 1383) Used in
    section 1357*.
\langle Current mem equivalent of glue parameter number n 250 \rangle Used in sections 176* and 178.
\langle \text{ Deactivate node } r 908 \rangle Used in section 899.
 Declare \varepsilon-T<sub>E</sub>X procedures for expanding 1564, 1622, 1627, 1631 \rangle Used in section 396*.
 Declare ε-T<sub>F</sub>X procedures for scanning 1493, 1584, 1593, 1598, 1694* Used in section 443.
 Declare \varepsilon-TeX procedures for token lists 1494, 1565 \tag{ Used in section 499.
 Declare \varepsilon-T<sub>F</sub>X procedures for tracing and input 314, 1472, 1473, 1568, 1569, 1586, 1588, 1589, 1633, 1635, 1649,
    1650, 1651, 1652, 1653 \ Used in section 298.
\langle \text{Declare } \varepsilon\text{-TFX} \text{ procedures for use by } main\_control 1467, 1490, 1506} \rangle Used in section 863.

 Display the whatsit node p 1417 \ Used in section 209.
 Display token p, and return if there are problems 323 \ Used in section 322.
 Do first-pass processing based on type(q); goto done_with_noad if a noad has been fully processed, goto
    check_dimensions if it has been translated into new_hlist(q), or goto done_with_node if a node has been
    fully processed 771 \ Used in section 770.
(Do ligature or kern command, returning to main_lig_loop or main_loop_wrapup or main_loop_move 1094)
    Used in section 1093.
 Do magic computation 350 Vsed in section 322.
 Do some work that has been queued up for \write 1438*\) Used in section 1437*.
 Drop current token and complain that it was unmatched 1120 \> Used in section 1118.
 Dump MLT<sub>E</sub>X-specific data 1701* Used in section 1357*.
 Dump a couple more things and the closing check word 1381 \ Used in section 1357*.
 Dump constants for consistency check 1362* Used in section 1357*.
 Dump regions 1 to 4 of eqtb 1370^* Used in section 1368.
 Dump regions 5 and 6 of eqtb 1371^* Used in section 1368.
 Dump the \varepsilon-T<sub>F</sub>X state 1465, 1570 \ Used in section 1362*.
 Dump the array info for internal font number k 1377* Used in section 1375*.
 Dump the dynamic memory 1366* Used in section 1357*.
 Dump the font information 1375* Used in section 1357*.
 Dump the hash table 1373* Used in section 1368.
 Dump the hyphenation tables 1379^* Used in section 1357^*.
 Dump the string pool 1364^* Used in section 1357^*.
 Dump the table of equivalents 1368 \ Used in section 1357*.
Either append the insertion node p after node q, and remove it from the current page, or delete
    node(p) 1076 \rightarrow Used in section 1074.
Either insert the material specified by node p into the appropriate box, or hold it for the next page; also
```

delete node p from the current page 1074 V Used in section 1068.

```
\langle Either process \ifcase or set b to the value of a boolean condition 536*\rangle Used in section 533.
 Empty the last bytes out of dvi_buf 635* Used in section 680*.
 Enable \varepsilon-TeX, if requested 1452* Used in section 1392*.
 Ensure that box 255 is empty after output 1082 \ Used in section 1080.
 Ensure that box 255 is empty before output 1069 \ Used in section 1068.
 Ensure that trie\_max \ge h + max\_hyph\_char 1008 Used in section 1007.
 Enter a hyphenation exception 993* Used in section 989.
 Enter all of the patterns into a linked trie, until coming to a right brace 1015 Used in section 1014*.
 Enter as many hyphenation exceptions as are listed, until coming to a right brace; then return 989
    in section 988*.
Enter skip\_blanks state, emit a space 379 \rangle Used in section 377.
 Error handling procedures 82, 85*, 86*, 97*, 98*, 99*, 1456 \rightarrow Used in section 4*.
 Evaluate the current expression 1604 \rangle Used in section 1595.
Examine node p in the hlist, taking account of its effect on the dimensions of the new box, or moving it to
    the adjustment list; then advance p to the next node 691 \( \) Used in section 689.
Examine node p in the vlist, taking account of its effect on the dimensions of the new box; then advance p
    to the next node 711 \ Used in section 710.
\langle \text{ Expand a nonmacro } 399 \rangle Used in section 396*.
\langle Expand macros in the token list and make link(def\_ref) point to the result 1435\rangle Used in sections 1432
    and 1434*.
\langle \text{ Expand the next part of the input 513} \rangle Used in section 512.
 Expand the token after the next token 400 Vsed in section 399.
 Explain that too many dead cycles have occurred in a row 1078 \( \) Used in section 1066.
 Express astonishment that no number was here 480 \ Used in section 478.
 Express consternation over the fact that no alignment is in progress 1182
 Express shock at the missing left brace; goto found 510 Used in section 509.
 Feed the macro body and its parameters to the scanner 424 \ Used in section 423.
 Fetch a box dimension 454 \rangle Used in section 447.
 Fetch a character code from some table 448 \rangle Used in section 447.
 Fetch a font dimension 459 \ Used in section 447.
 Fetch a font integer 460 \ Used in section 447.
 Fetch a penalties array element 1678 \ Used in section 457.
 Fetch a register 461 \rightarrow Used in section 447.
 Fetch a token list or font identifier, provided that level = tok_{-}val 449 Used in section 447.
 Fetch an internal dimension and goto attach_sign, or fetch an internal integer 484 Used in section 482.
 Fetch an item in the current node, if appropriate 458 \u2225 Used in section 447.
 Fetch first character of a sub/superscript 805 \> Used in sections 801, 802, and 803.
 Fetch something on the page\_so\_far 455\rangle Used in section 447.
 Fetch the dead_cycles or the insert_penalties 453 \rangle Used in section 447.
 Fetch the par\_shape size 457 Used in section 447.
 Fetch the prev\_graf 456 \rightarrow Used in section 447.
 Fetch the space\_factor or the prev\_depth 452 \rightarrow Used in section 447.
 Find an active node with fewest demerits 922 \ Used in section 921.
 Find hyphen locations for the word in hc, or return 977^* Used in section 944.
 Find optimal breakpoints 911 \ Used in section 863.
 Find the best active node for the desired looseness 923 \ Used in section 921.
 Find the best way to split the insertion, and change type(r) to split_up 1064
                                                                                      Used in section 1062.
 Find the glue specification, main_p, for text spaces in the current font 1096 Used in sections 1095 and 1097.
 Finish an alignment in a display 1260 \ Used in section 860.
 Finish displayed math 1253 \ Used in section 1248.
 Finish hlist SyncT_FX information record 1727* Used in section 655*.
 Finish issuing a diagnostic message for an overfull or underfull hbox 705 \ Used in section 689.
```

```
(Finish issuing a diagnostic message for an overfull or underfull vbox 717) Used in section 710.
 Finish line, emit a \par 381 \rightarrow
                                                  Used in section 377.
 Finish line, emit a space 378 Used in section 377.
 Finish line, goto switch 380 V Used in section 377.
 Finish math in text 1250 \ Used in section 1248.
 Finish sheet SyncT_{FX} information record 1723*
                                                                                 Used in section 676*.
 Finish the DVI file 680^* Used in section 1388*.
 Finish the extensions 1442 \rangle Used in section 1388*.
 Finish the natural width computation 1547 \ Used in section 1200.
 Finish the reversed hlist segment and goto done 1541* Used in section 1540.
 Finish vlist SyncT_{EX} information record 1725^* Used in section 667^*.
 Finish hlist_out for mixed direction typesetting 1526 \ Used in section 655*.
 Fire up the user's output routine and return 1079 Used in section 1066.
 Fix the reference count, if any, and negate cur_val if negative 464 Used in section 447.
 Flush the box from memory, showing statistics if requested 677 Used in section 676*.
 Flush the prototype box 1555 Used in section 1253.
 Forbidden cases detected in main_control 1102, 1152, 1165, 1198 \ Used in section 1099.
 Generate a down or right command for w and return 646 \ Used in section 643.
 Generate a y\theta or z\theta command in order to reuse a previous appearance of w 645 \( \) Used in section 643.
\langle \text{ Generate all } \varepsilon\text{-TFX primitives } 1400, 1453, 1468, 1474, 1477, 1480, 1483, 1486, 1495, 1497, 1500, 1503, 1508, 1512, 1559, 1497, 1500, 1503, 1508, 1512, 1559, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 15000, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 15000, 1500, 1500, 15000, 15000, 1500, 15000, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 1500, 
      1571, 1574, 1582, 1590, 1613, 1617, 1621, 1673, 1676 Used in section 1452*.
\langle Get ready to compress the trie 1006\rangle Used in section 1020*.
(Get ready to start line breaking 864, 875, 882, 896) Used in section 863.
(Get substitution information, check it, goto found if all is ok, otherwise goto continue 1698*) Used in
      section 1696*.
(Get the first line of input and prepare to start 1392*) Used in section 1387*.
(Get the next non-blank non-call token 440) Used in sections 439, 475, 490, 538, 561*, 612, 1099, 1596, and 1597.
(Get the next non-blank non-relax non-call token 438) Used in sections 437, 561*, 1132, 1138, 1205, 1214, 1265,
      1280, and 1324.
(Get the next non-blank non-sign token; set negative appropriately 475) Used in sections 474, 482, and 496.
 Get the next token, suppressing expansion 388 \ Used in section 387.
 Get user's advice and return 87 Used in section 86*.
 Give diagnostic information, if requested 1085 \ Used in section 1084.
 Give improper \hyphenation error 990 \rightarrow Used in section 989.

(Go into display math mode 1199) Used in section 1192.
(Go into ordinary math mode 1193*) Used in sections 1192 and 1196.
Go through the preamble list, determining the column widths and changing the alignrecords to dummy
      unset boxes 849 \ Used in section 848.
Grow more variable-size memory and goto restart 148 Used in section 147*.
 Handle \readline and goto done 1573 \ Used in section 518.
 Handle \unexpanded or \detokenize and return 1499 \underset Used in section 500.
 Handle a glue node for mixed direction typesetting 1510 Used in sections 663 and 1538.
 Handle a math node in hlist_out\ 1527 Used in section 660*.
 Handle non-positive logarithm 125 Used in section 123.
 Handle saved items and goto done 1675 Used in section 1164.
```

- (Handle situations involving spaces, braces, changes of state 377) Used in section 374.
- $\langle$  Hyphenate the *native\_word\_node* at *ha* 957 $\rangle$  Used in section 956.
- $\langle$  If a line number class has ended, create new active nodes for the best feasible breaks in that class; then **return** if  $r = last\_active$ , otherwise compute the new  $line\_width$  883 $\rangle$  Used in section 877.
- $\langle$  If all characters of the family fit relative to h, then **goto** found, otherwise **goto** not\_found 1009 $\rangle$  Used in section 1007.
- (If an alignment entry has just ended, take appropriate action 372) Used in section 371.
- (If an expanded code is present, reduce it and goto start\_cs 385) Used in sections 384 and 386.
- (If dumping is not allowed, abort 1359) Used in section 1357\*.
- $\langle$  If instruction  $cur_{-}i$  is a kern with  $cur_{-}c$ , attach the kern after q; or if it is a ligature with  $cur_{-}c$ , combine noads q and p appropriately; then **return** if the cursor has moved past a noad, or **goto** restart 797 $\rangle$  Used in section 796.
- (If no hyphens were found, **return** 955) Used in section 944.
- $\langle$  If node  $cur_p$  is a legal breakpoint, call  $try_break$ ; then update the active widths by including the glue in  $glue_ptr(cur_p)$  916 $\rangle$  Used in section 914.
- (If node p is a legal breakpoint, check if this break is the best known, and **goto** done if p is null or if the page-so-far is already too full to accept more stuff 1026) Used in section 1024.
- (If node q is a style node, change the style and **goto**  $delete_{-}q$ ; otherwise if it is not a noad, put it into the hlist, advance q, and **goto** done; otherwise set s to the size of noad q, set t to the associated type  $(ord\_noad ... inner\_noad)$ , and set pen to the associated penalty 809) Used in section 808.
- $\langle$  If node r is of type  $delta\_node$ , update  $cur\_active\_width$ , set  $prev\_r$  and  $prev\_prev\_r$ , then **goto** continue 880  $\rangle$  Used in section 877.
- $\langle$  If the current list ends with a box node, delete it from the list and make  $cur\_box$  point to it; otherwise set  $cur\_box \leftarrow null \ 1134 \rangle$  Used in section 1133.
- (If the current page is empty and node p is to be deleted, **goto** done1; otherwise use node p to update the state of the current page; if this node is an insertion, **goto** contribute; otherwise if this node is not a legal breakpoint, **goto** contribute or  $update\_heights$ ; otherwise set pi to the penalty associated with this breakpoint 1054) Used in section 1051.
- (If the cursor is immediately followed by the right boundary, **goto** reswitch; if it's followed by an invalid character, **goto** big\_switch; otherwise move the cursor one step to the right and **goto** main\_lig\_loop 1090\*) Used in section 1088\*.
- (If the next character is a parameter number, make *cur\_tok* a *match* token; but if it is a left brace, store '*left\_brace*, *end\_match*', set *hash\_brace*, and **goto** *done* 511) Used in section 509.
- (If the preamble list has been traversed, check that the row has ended 840) Used in section 839.
- (If the right-hand side is a token parameter or token register, finish the assignment and **goto** done 1281) Used in section 1280.
- (If the string  $hyph\_word[h]$  is less than hc[1...hn], **goto**  $not\_found$ ; but if the two strings are equal, set hyf to the hyphen positions and **goto** found 985\*) Used in section 984\*.
- (If the string  $hyph\_word[h]$  is less than or equal to s, interchange  $(hyph\_word[h], hyph\_list[h])$  with (s, p) 995\*) Used in section 994\*.
- $\langle$  If there's a ligature or kern at the cursor position, update the data structures, possibly advancing j; continue until the cursor moves 963 $\rangle$  Used in section 960.
- $\langle$  If there's a ligature/kern command relevant to  $cur_{-}l$  and  $cur_{-}r$ , adjust the text appropriately; exit to  $main\_loop\_wrapup \ 1093 \rangle$  Used in section 1088\*.
- $\langle$  If this font has already been loaded, set f to the internal font number and **goto** common\_ending 1314\* $\rangle$  Used in section 1311\*.
- (If this  $sup\_mark$  starts an expanded character like ^^A or ^^df, then **goto** reswitch, otherwise set  $state \leftarrow mid\_line 382$ ) Used in section 374.
- (Ignore the fraction operation and complain about this ambiguous case 1237) Used in section 1235.
- (Implement \XeTeXdefaultencoding 1448) Used in section 1404\*.
- (Implement \XeTeXglyph 1445) Used in section 1404\*.
- (Implement \XeTeXinputencoding 1447) Used in section 1404\*.

(Incorporate character dimensions into the dimensions of the hbox that will contain it, then move to the
    next node 694 \rangle Used in section 691.
(Incorporate glue into the horizontal totals 698) Used in section 691.
(Incorporate glue into the vertical totals 713) Used in section 711.
Increase the number of parameters in the last font 615 \ Used in section 613.
 Increase k until x can be multiplied by a factor of 2^{-k}, and adjust y accordingly 124 \) Used in section 123.
 Initialize additional fields of the first active node 1657 \ Used in section 912.
 Initialize bigger nodes with SyncT_{FX} information 1715* Used in section 147*.
(Initialize for hyphenating a paragraph 939) Used in section 911.
(Initialize synctex primitive 1712*) Used in section 1387*.
(Initialize table entries (done by INITEX only) 189, 248*, 254, 258, 266*, 276, 285*, 587*, 1000*, 1005*, 1270, 1356*,
    1433, 1464, 1630, 1666 \rangle Used in section 8*.
(Initialize the LR stack 1521) Used in sections 689, 1525, and 1546.
(Initialize the current page, insert the \topskip glue ahead of p, and goto continue 1055) Used in
    section 1054.
\langle \text{Initialize the input routines } 361^* \rangle \text{ Used in section } 1392^*.
(Initialize the output routines 55, 65*, 563, 568) Used in section 1387*.
(Initialize the print selector based on interaction 79) Used in sections 1319*, 1347*, and 1392*.
 Initialize the special list heads and constant nodes 838, 845, 868, 1035, 1042* Used in section 189.
 Initialize variables as ship\_out begins 653* Used in section 678*.
 Initialize variables for \varepsilon-TFX compatibility mode 1624 \rangle Used in sections 1464 and 1466.
 Initialize variables for \varepsilon-TFX extended mode 1625 \rangle Used in sections 1452* and 1466.
 Initialize whatever TeX might access 8*, 1711* Used in section 4*.
 Initialize hlist_out for mixed direction typesetting 1525 \rangle Used in section 655*.
Initiate input from new pseudo file 1567* Used in section 1565.
Initiate or terminate input from a file 412 \ Used in section 399.
 Initiate the construction of an abox or vbox, then return 1137 Used in section 1133.
 Input and store tokens from the next line of the file 518 \( \) Used in section 517.
 Input for \read from the terminal 519* \ Used in section 518.
(Input from external file, goto restart if no input found 373) Used in section 371.
(Input from token list, goto restart if end of list or if a parameter needs to be expanded 387) Used in
    section 371.
\langle \text{ Input the first line of } read\_file[m] 520 \rangle Used in section 518.
\langle \text{ Input the next line of } read\_file[m] 521 \rangle Used in section 518.
```

```
(Insert LR nodes at the beginning of the current line and adjust the LR stack based on LR nodes in this
    line 1518 Used in section 928.
(Insert LR nodes at the end of the current line 1520) Used in section 928.
\langle Insert a delta node to prepare for breaks at cur_p 891 \rangle Used in section 884.
(Insert a delta node to prepare for the next active node 892) Used in section 884.
 Insert a dummy noad to be sub/superscripted 1231 \rangle Used in section 1230.
 Insert a new active node from best_place | fit_class | to cur_p 893 \rangle Used in section 884.
 Insert a new control sequence after p, then make p point to it 287^* Used in section 286.
 Insert a new pattern into the linked trie 1017* Used in section 1015.
 Insert a new primitive after p, then make p point to it 290 \ Used in section 289.
 Insert a new trie node between q and p, and make p point to it 1018* Used in sections 1017*, 1667, and 1668.
 Insert a token containing frozen\_endv 409 \rightarrow Used in section 396*.
 Insert a token saved by \afterassignment, if any 1323 \) Used in section 1265.
 Insert glue for split\_top\_skip and set p \leftarrow null\ 1023 \rightarrow Used in section 1022.
 Insert hyphens as specified in hyph_list[h] 986 Used in section 985*.
 Insert macro parameter and goto restart 389 \ Used in section 387.
 Insert the appropriate mark text into the scanner 420 \ Used in section 399.
 Insert the current list into its environment 860 \ Used in section 848.
 Insert the pair (s, p) into the exception table 994* Used in section 993*.
 Insert the \langle v_i \rangle template and goto restart 837 Used in section 372.
 Insert token p into TeX's input 356 \ Used in section 312.
\langle \text{Interpret code } c \text{ and } \mathbf{return} \text{ if done } 88^* \rangle Used in section 87.
 Introduce new material from the terminal and return 91 \( \) Used in section 88*.
(Issue an error message if cur_val = fmem_ptr 614) Used in section 613.
(Justify the line ending at breakpoint curp, and append it to the current vertical list, together with
    associated penalties and other insertions 928 \ Used in section 925.
(Last-minute procedures 1388*, 1390*, 1391, 1393*) Used in section 1385.
\langle Lengthen the preamble periodically \,841\,\rangle\, Used in section \,840.\,
(Let cur_h be the position of the first box, and set leader_w d + lx to the spacing between corresponding
    parts of boxes 665 \ Used in section 664.
(Let cur_v be the position of the first box, and set leader_t + lx to the spacing between corresponding
    parts of boxes 674 Used in section 673.
(Let d be the natural width of node p; if the node is "visible," goto found; if the node is glue that stretches
    or shrinks, set v \leftarrow max\_dimen \ 1201 \rightarrow Used in section 1200.
(Let d be the natural width of this glue; if stretching or shrinking, set v \leftarrow max\_dimen; goto found in the
    case of leaders 1202 V Used in section 1201.
(Let d be the width of the whatsit p, and goto found if "visible" 1422) Used in section 1201.
(Let j be the prototype box for the display 1552) Used in section 1546.
(Let n be the largest legal code value, based on cur_chr 1287) Used in section 1286.
\langle \text{Link node } p \text{ into the current page and goto } done 1052 \rangle Used in section 1051.
(Local variables for dimension calculations 485) Used in section 482.
(Local variables for finishing a displayed formula 1252, 1553) Used in section 1248.
 Local variables for formatting calculations 345 \ Used in section 341.
 Local variables for hyphenation 954, 966, 976, 983 \ Used in section 944.
(Local variables for initialization 19*, 188, 981) Used in section 4*.
(Local variables for line breaking 910, 942, 948) Used in section 863.
(Look ahead for another character, or leave liq_stack empty if there's none there 1092) Used in section 1088*.
(Look at all the marks in nodes before the break, and set the final link to null at the break 1033) Used in
    section 1031.
Look at the list of characters starting with x in font q; set f and c whenever a better character is found;
```

goto found as soon as a large enough variant is encountered 751\* Used in section 750.

Look at the other stack entries until deciding what sort of DVI command to generate; goto found if node p is a "hit" 647 \ Used in section 643. (Look at the variants of (z,x); set f and c whenever a better character is found; **goto** found as soon as a large enough variant is encountered 750 \ Used in section 749. (Look for parameter number or ## 514) Used in section 512. (Look for the word hc[1...hn] in the exception table, and **goto** found (with hyf containing the hyphens) if an entry is found 984\* Used in section 977\*. (Look up the characters of list n in the hash table, and set  $cur_cs$  1580) Used in section 1579.  $\langle$  Look up the characters of list r in the hash table, and set cur-cs 408 $\rangle$  Used in section 406. Make a copy of node p in node r 231 \times Used in section 230. (Make a ligature node, if *ligature\_present*; insert a null discretionary, if appropriate 1089) Used in section 1088\*.  $\langle$  Make a partial copy of the whatsit node p and make r point to it; set words to the number of initial words not yet copied 1418 Used in sections  $232^*$  and  $1545^*$ . (Make a second pass over the mlist, removing all noads and inserting the proper spacing and penalties 808) Used in section 769.  $\langle$  Make final adjustments and **goto** done 611\* $\rangle$  Used in section 597.  $\langle$  Make node p look like a char\_node and **goto** reswitch 692  $\rangle$  Used in sections 660\*, 691, and 1201.  $\langle$  Make sure that f is in the proper range 1602 $\rangle$  Used in section 1595. Make sure that  $page\_max\_depth$  is not exceeded 1057 \rangle Used in section 1051. Make sure that pi is in the proper range 879 Used in section 877. Make the contribution list empty by setting its tail to contrib\_head 1049 \rangle Used in section 1048. Make the first 256 strings 48 Used in section  $47^*$ . Make the height of box y equal to h 782 \ Used in section 781. Make the running dimensions in rule q extend to the boundaries of the alignment 854 Used in section 853.  $\langle$  Make the unset node r into a vlist\_node of height w, setting the glue as if the height were t 859 $\rangle$  Used in section 856.  $\langle$  Make the unset node r into an hlist\_node of width w, setting the glue as if the width were t 858 $\rangle$  Used in section 856.  $\langle$  Make variable b point to a box for (f,c) 753 $\rangle$  Used in section 749. (Manufacture a control sequence name 406) Used in section 399. (Math-only cases in non-math modes, or vice versa 1100) Used in section 1099. (Merge sequences of words using native fonts and inter-word spaces into single nodes 656) Used in section 655\*.  $\langle$  Merge the widths in the span nodes of q with those of p, destroying the span nodes of q 851 $\rangle$  Used in section 849. \(\) Modify the end of the line to reflect the nature of the break and to include \right\(\)rig\(\)rig\(\)right\(\)right\(\)right\(\)right\(\)right\(\)right\(\)right\(\)right value of  $disc\_break$  929 \rightarrow Used in section 928.  $\langle$  Modify the glue specification in  $main_p$  according to the space factor 1098 $\rangle$  Used in section 1097. (Move down or output leaders 672) Used in section 669. (Move node p to the current page; if it is time for a page break, put the nodes following the break back onto the contribution list, and **return** to the user's output routine if there is one 1051 \( \rightarrow \) Used in section 1048. Move node p to the new list and go to the next node; or **goto** done if the end of the reflected segment has been reached 1535 \ Used in section 1534.  $\langle$  Move pointer s to the end of the current list, and set  $replace\_count(r)$  appropriately 972  $\rangle$  Used in section 968. (Move right or output leaders 663) Used in section 660\*. (Move the characters of a ligature node to hu and hc; but **goto** done3 if they are not all letters 951) Used in section 950.

(Move the cursor past a pseudo-ligature, then **goto** main\_loop\_lookahead or main\_liq\_loop\_1091\*) Used in

 $\langle$  Move the data into trie 1012\* $\rangle$  Used in section 1020\*.

section 1088\*.

 $\langle$  Move the non-char\_node p to the new list 1536\* $\rangle$  Used in section 1535.

```
(Move to next line of file, or goto restart if there is no next line, or return if a \read line has finished 390)
    Used in section 373.
\langle \text{ Negate a boolean conditional and goto } reswitch | 1577 \rangle Used in section 399.
\langle Negate all three glue components of cur_val 465 \rangle Used in sections 464 and 1592.
 Nullify width(q) and the tabskip glue following this column 850 \( \) Used in section 849.
 Numbered cases for debug\_help\ 1394^* Used in section 1393*.
 Open tfm_{-}file for input and begin 598* Used in section 597.
 Other local variables for try_break 878, 1656 \ Used in section 877.
 Output a box in a vlist 670^* Used in section 669.
 Output a box in an hlist 661^* Used in section 660^*.
 Output a leader box at cur_h, then advance cur_h by leader_wd + lx 666 Used in section 664.
 Output a leader box at cur_v, then advance cur_v by leader_t + lx 675 Used in section 673.
 Output a rule in a vlist, goto next_p 671 Used in section 669.
 Output a rule in an hlist 662 Used in section 660^*.
 Output a substitution, goto continue if not possible 1696* Used in section 658*.
 Output leaders in a vlist, goto fin_rule if a rule or to next_p if done 673 \text{\rightarrow} Used in section 672.
 Output leaders in an hlist, goto fin_rule if a rule or to next_p if done 664 \ Used in section 663.
Output node p for hlist_out and move to the next node, maintaining the condition cur_v = base\_line 658*
    Used in section 655*.
Output node p for vlist_out and move to the next node, maintaining the condition cur_h = left_edge 668
    Used in section 667*.
(Output statistics about this job 1389*) Used in section 1388*.
 Output the font definitions for all fonts that were used 681 \ Used in section 680*.
 Output the font name whose internal number is f(639) Used in section 638*.
 Output the non-char_node p for hlist_out and move to the next node 660^{\circ} Used in section 658^{\circ}.
 Output the non-char_node p for vlist_out 669 Used in section 668.
 Output the whatsit node p in a vlist 1427 Used in section 669.
 Output the whatsit node p in an hlist 1431 \ Used in section 660^*.
 Pack all stored hyph\_codes 1669 \ Used in section 1020*.
 Pack the family into trie relative to h 1010 Used in section 1007.
 Package an unset box for the current column and record its width 844 \( \rightarrow \) Used in section 839.
 Package the display line 1558 \ Used in section 1556.
 Package the preamble list, to determine the actual tabskip glue amounts, and let p point to this prototype
    box 852 Vsed in section 848.
 Perform computations for last line and goto found 1658 \ Used in section 900.
 Perform the default output routine 1077 \ Used in section 1066.
 Pontificate about improper alignment in display 1261 \rangle Used in section 1260.
 Pop the condition stack 531 \ Used in sections 533, 535, 544, and 545.
 Pop the expression stack and goto found 1601 \text{ Used in section 1595.
 Prepare a native_word_node for hyphenation 946 \ Used in section 943.
 Prepare all the boxes involved in insertions to act as queues 1072 \> Used in section 1068.
 Prepare for display after a non-empty paragraph 1546 \ Used in section 1200.
 Prepare for display after an empty paragraph 1544 \ Used in section 1199.
 Prepare new file SyncT_{FX} information 1717* Used in section 572*.
 Prepare pseudo file SyncT<sub>E</sub>X information 1719* Used in section 1567*.
 Prepare terminal input SyncT_{FX} information 1718* Used in section 358*.
Prepare to deactivate node r, and goto deactivate unless there is a reason to consider lines of text from r
    to cur_p 902 Used in section 899.
\langle \text{Prepare to insert a token that matches } cur\_group, \text{ and print what it is } 1119 \rangle Used in section 1118.
 Prepare to move a box or rule node to the current page, then goto contribute 1056 Used in section 1054.
 Prepare to move whatsit p to the current page, then goto contribute 1425 \( \rightarrow \) Used in section 1054.
```

 $\langle$  Print a short indication of the contents of node p 201 $\rangle$  Used in section 200\*.

```
(Print a symbolic description of the new break node 894) Used in section 893.
 Print a symbolic description of this feasible break 904 \ Used in section 903.
 Print additional data in the new active node 1664 \ Used in section 894.
 Print character substitution tracing log 1699* Used in section 1696*.
 Print either 'definition' or 'use' or 'preamble' or 'text', and insert tokens that should lead to
    recovery 369* Used in section 368*.
 Print location of current line 343 \ Used in section 342.
 Print newly busy locations 196 \> Used in section 192.
 Print string s as an error message 1337 Used in section 1333.
 Print string s on the terminal 1334 Used in section 1333.
 Print the banner line, including the date and time 571* Used in section 569*.
 Print the font identifier for font(p) 297 \ Used in sections 200* and 202*.
 Print the help information and goto continue 93 Used in section 88*.
 Print the list between printed_node and cur_p, then set printed_node \leftarrow cur_p = 905 Used in section 904.
 Print the menu of available options 89 \ Used in section 88*.
 Print the result of command c 507 Used in section 505.
 Print two lines using the tricky pseudoprinted information 347 \ Used in section 342.
 Print type of token list 344 \ Used in section 342.
 Process an active-character control sequence and set state \leftarrow mid\_line~383 \quad Used in section 374.
 Process an expression and return 1592 \ Used in section 458.
 Process node-or-noad q as much as possible in preparation for the second pass of mlist\_to\_hlist, then move
    to the next item in the mlist 770 Used in section 769.
 Process whatsit p in vert_break loop, goto not_found 1426 \rangle Used in section 1027.
Prune the current list, if necessary, until it contains only char_node, kern_node, hlist_node, vlist_node,
    rule\_node, and ligature\_node items; set n to the length of the list, and set q to the list's tail 1175 \rangle Used
    in section 1173.
Prune unwanted nodes at the beginning of the next line 927 Used in section 925.
 Pseudoprint the line 348 \ Used in section 342.
 Pseudoprint the token list 349 \ Used in section 342.
 Push the condition stack 530 \ Used in section 533.
 Push the expression stack and goto restart 1600 \ Used in section 1597.
 Put each of T<sub>F</sub>X's primitives into the hash table 252, 256*, 264*, 274, 295, 364, 410, 418, 445, 450, 503, 522, 526,
    588, 828, 1037, 1106, 1112, 1125, 1142, 1161, 1168, 1195, 1210, 1223, 1232, 1242, 1262, 1273, 1276*, 1284, 1304, 1308,
    1316, 1326, 1331, 1340, 1345, 1399^*, 1707^* Used in section 1391.
(Put help message on the transcript file 94) Used in section 86*.
(Put the characters hu[i+1...] into post\_break(r), appending to this list and to major\_tail until
    synchronization has been achieved 970 \ Used in section 968.
\langle \text{Put the characters } hu[l \dots i] \text{ and a hyphen into } pre\_break(r) 969 \rangle Used in section 968.
 Put the fraction into a box with its delimiters, and make new_-hlist(q) point to it 792 \( \) Used in section 787.
 Put the \leftskip glue at the left and detach this line 935 \ Used in section 928.
Put the optimal current page into box 255, update first_mark and bot_mark, append insertions to their
    boxes, and put the remaining nodes back on the contribution list 1068 Used in section 1066.
\langle \text{ Put the (positive) 'at' size into } s \text{ 1313} \rangle Used in section 1312.
\langle \text{ Put the } \rangle Used in section 929.
Read and check the font data if file exists; abort if the TFM file is malformed; if there's no room for this
    font, say so and goto done; otherwise incr(font_ptr) and goto done 597 Used in section 595*.
\langle \text{ Read box dimensions } 606 \rangle Used in section 597.
 Read character data 604 \> Used in section 597.
 Read extensible character recipes 609 \ Used in section 597.
 Read font parameters 610^* Used in section 597.
 Read ligature/kern program 608* Used in section 597.
 Read next line of file into buffer, or goto restart if the file has ended 392 Used in section 390.
```

```
(Read the first line of the new file 573) Used in section 572*.
Read the other strings from the TEX.POOL file and return true, or give an error message and return
    false 51^* Used in section 47*.
(Read the TFM header 603) Used in section 597.
\langle \text{ Read the TFM size fields 600} \rangle Used in section 597.
 Readjust the height and depth of cur\_box, for \forall vtop 1141 \rangle Used in section 1140.
 Rebuild character using substitution information 1700* Used in section 1696*.
 Reconstitute nodes for the hyphenated word, inserting discretionary hyphens 967 Used in section 956.
 Record a new feasible break 903 \ Used in section 899.
 Record current point SyncT<sub>F</sub>X information 1729* Used in section 658*.
 Record horizontal rule_node or glue_node SyncT<sub>F</sub>X information 1730* Used in section 660*.
 Record void list SyncT_{FX} information 1728* Used in sections 661* and 670*.
 Record kern_node SyncT<sub>F</sub>X information 1731* Used in section 660*.
 Record math\_node\ SyncT_{FX}\ information\ 1732^* Used in section 660*.
 Recover from an unbalanced output routine 1081 \ Used in section 1080.
 Recover from an unbalanced write command 1436 \ Used in section 1435.
 Recycle node p 1053 \ Used in section 1051.
 Reduce to the case that a, c \ge 0, b, d > 0 127 \ Used in section 126.
 Reduce to the case that f \ge 0 and q > 0 119 \quad Used in section 118.
 Remove the last box, unless it's part of a discretionary 1135 \ Used in section 1134.
(Replace nodes ha ... hb by a sequence of nodes that includes the discretionary hyphens 956) Used in
    section 944.
Replace the tail of the list by p 1241\rangle Used in section 1240.
 Replace z by z' and compute \alpha, \beta 607 \ Used in section 606.
 Report LR problems 1524 \rangle Used in sections 1523 and 1542.
 Report a runaway argument and abort 430 \ Used in sections 426 and 433.
 Report a tight hbox and goto common_ending, if this box is sufficiently bad 709
                                                                                         Used in section 706.
 Report a tight vbox and goto common_ending, if this box is sufficiently bad 720
                                                                                         Used in section 718.
 Report an extra right brace and goto continue 429 Used in section 426.
 Report an improper use of the macro and abort 432 \ Used in section 431.
 Report an overfull hbox and goto common_ending, if this box is sufficiently bad 708
                                                                                             Used in section 706.
 Report an overfull vbox and goto common_ending, if this box is sufficiently bad 719
                                                                                             Used in section 718.
 Report an underfull hbox and goto common_ending, if this box is sufficiently bad 702)
                                                                                               Used in section 700.
 Report an underfull vbox and goto common_ending, if this box is sufficiently bad 716)
                                                                                               Used in section 715.
 Report overflow of the input buffer, and abort 35^* Used in sections 31^* and 1568.
 Report that an invalid delimiter code is being changed to null; set cur_val \leftarrow 0 1215 Used in section 1214.
 Report that the font won't be loaded 596* Used in section 595*.
 Report that this dimension is out of range 495 \ Used in section 482.
 Reset cur_tok for unexpandable primitives, goto restart 403 \rangle Used in sections 447 and 474.
 Resume the page builder after an output routine has come to an end 1080 \ Used in section 1154*.
 Retrieve the prototype box 1554 \rangle Used in sections 1248 and 1248.
 Reverse an hlist segment and goto reswitch 1533* Used in section 1528.
 Reverse the complete hlist and set the subtype to reversed 1532* Used in section 1525.
 Reverse the links of the relevant passive nodes, setting cur_p to the first breakpoint 926 Used in section 925.
 Save current position to pdf\_last\_x\_pos, pdf\_last\_y\_pos 1428 \rangle Used in sections 1427 and 1431.
 Scan a control sequence and set state \leftarrow skip\_blanks or mid\_line 384 \ Used in section 374.
 Scan a factor f of type o or start a subexpression 1597 \rangle Used in section 1595.
(Scan a numeric constant 478) Used in section 474.
Scan a parameter until its delimiter string has been found; or, if s = null, simply scan the delimiter
    string 426 V Used in section 425.
(Scan a subformula enclosed in braces and return 1207) Used in section 1205.
```

```
(Scan ahead in the buffer until finding a nonletter; if an expanded code is encountered, reduce it and
    goto start_cs; otherwise if a multiletter control sequence is found, adjust cur_cs and loc, and goto
    found 386 V Used in section 384.
(Scan an alphabetic character code into cur_val 476) Used in section 474.
(Scan an optional space 477) Used in sections 476, 482, 490, and 1254.
 Scan and build the body of the token list; goto found when finished 512 \) Used in section 508.
 Scan and build the parameter part of the macro definition 509 \ Used in section 508.
 Scan and evaluate an expression e of type l 1595 \ Used in section 1594.
 Scan decimal fraction 487 Used in section 482.
 Scan file name in the buffer 566 \ Used in section 565*.
(Scan for all other units and adjust cur_val and f accordingly; goto done in the case of scaled points 493)
    Used in section 488.
(Scan for fil units; goto attach_fraction if found 489) Used in section 488.
 Scan for mu units and goto attach_fraction 491 \rightarrow Used in section 488.
(Scan for units that are internal dimensions; goto attach_sign with cur_val set if found 490) Used in
    section 488.
Scan preamble text until cur_cmd is tab_mark or car_ret, looking for changes in the tabskip glue; append
    an alignrecord to the preamble list 827 \ Used in section 825.
\langle Scan the argument for command c 506\rangle Used in section 505.
(Scan the font size specification 1312) Used in section 1311*.
 Scan the next operator and set o(1596) Used in section 1595.
(Scan the parameters and make link(r) point to the macro body; but return if an illegal \par is
    detected 425 V Used in section 423.
(Scan the preamble and record it in the preamble list 825) Used in section 822.
(Scan the template \langle u_j \rangle, putting the resulting token list in hold\_head~831) Used in section 827.
(Scan the template \langle v_i \rangle, putting the resulting token list in hold_head 832) Used in section 827.
(Scan units and set cur\_val to x \cdot (cur\_val + f/2^{16}), where there are x sp per unit; goto attach\_sign if the
    units are internal 488 \ Used in section 482.
\langle Search eqtb for equivalents equal to p 281\rangle Used in section 197.
 Search hyph\_list for pointers to p 987 \ Used in section 197.
 Search save\_stack for equivalents that point to p 315 \(\rightarrow\) Used in section 197.
 Select the appropriate case and return or goto common_ending 544 Used in section 536*.
Set initial values of key variables 23*, 24*, 62, 78*, 81, 84, 101, 122, 191, 241*, 280, 284*, 302, 317, 398, 417, 473, 516,
    525, 586*, 591, 629, 632, 642, 687, 696, 704, 727, 819, 941, 982*, 1044, 1087, 1321, 1336, 1355, 1398, 1413, 1517, 1563,
    1629, 1648, 1672, 1680^*, 1689^*, 1693^* Used in section 8*.
(Set line length parameters in preparation for hanging indentation 897) Used in section 896.
 Set the glue in all the unset boxes of the current list 853 Used in section 848.
(Set the glue in node r and change it from an unset node 856) Used in section 855.
(Set the unset box q and the unset boxes in it 855) Used in section 853.
\langle Set the value of b to the badness for shrinking the line, and compute the corresponding fit_class 901\rangle Used
    in section 899.
(Set the value of b to the badness for stretching the line, and compute the corresponding fit_class 900)
    Used in section 899.
Set the value of b to the badness of the last line for shrinking, compute the corresponding fit_class, and
    goto found 1660 V Used in section 1658.
\langle Set the value of b to the badness of the last line for stretching, compute the corresponding fit_class, and
    goto found 1659 V Used in section 1658.
\langle Set the value of output_penalty 1067\rangle Used in section 1066.
\langle Set the value of x to the text direction before the display 1543\rangle
                                                                       Used in sections 1544 and 1546.
\langle Set up data structures with the cursor following position j = 962 \rangle
                                                                        Used in section 960.
(Set up the hlist for the display line 1557) Used in section 1556.
```

```
(Set up the values of cur_size and cur_mu, based on cur_style 746) Used in sections 763, 769, 770, 773, 798, 805,
    805, 808, 810, and 811.
\langle Set variable c to the current escape character 269\rangle Used in section 67.
 Set variable w to indicate if this case should be reported 1587 Used in sections 1586 and 1588.
 Ship box p out 678* Used in section 676*.
 Show equivalent n, in region 1 or 2 249 \rightarrow Used in section 278*.
 Show equivalent n, in region 3 255 \ Used in section 278*.
 Show equivalent n, in region 4 259
                                        Used in section 278*.
 Show equivalent n, in region 5 268
                                         Used in section 278*.
 Show equivalent n, in region 6 277
                                        Used in section 278*.
 Show the auxiliary field, a 245^* Used in section 244.
 Show the box context 1492 Vsed in section 1490.
 Show the box packaging info 1491 \ Used in section 1490.
 Show the current contents of a box 1351^* Used in section 1347^*.
 Show the current meaning of a token, then goto common_ending 1349* Used in section 1347*.
(Show the current value of some parameter or register, then goto common_ending 1352*) Used in
    section 1347*.
\langle \text{Show the font identifier in } eqtb[n] | 260 \rangle Used in section 259.
 Show the halfword code in eqtb[n] 261 \rangle Used in section 259.
 Show the status of the current page 1040 \ Used in section 244.
 Show the text of the macro being expanded 435^* Used in section 423.
 Simplify a trivial box 764* Used in section 763.
 Skip to \else or \fi, then goto common_ending 535 \ Used in section 533.
 Skip to node ha, or goto done1 if no hyphenation should be attempted 949 \ Used in section 943.
 Skip to node hb, putting letters into hu and hc 950 \quad Used in section 943.
 Sort p into the list starting at rover and advance p to rlink(p) 154 Used in section 153.
 Sort the hyphenation op tables into proper order 999* Used in section 1006.
 Split off part of a vertical box, make cur_box point to it 1136 \( \) Used in section 1133.
 Split the native\_word\_node at l and link the second part after ha~947 \quad Used in sections 946 and 946.
Squeeze the equation as much as possible; if there is an equation number that should go on a separate line
    by itself, set e \leftarrow 0 1255 \rightarrow Used in section 1253.
 Start a new current page 1045 \ Used in section 1071.
 Start hlist SyncT_{EX} information record 1726^* Used in section 655*.
 Start sheet SyncT_{FX} information record 1722* Used in section 676*.
 Start vlist SyncT_{FX} information record 1724* Used in section 667*.
 Store additional data for this feasible break 1662 Used in section 903.
 Store additional data in the new active node 1663 \ Used in section 893.
 Store cur\_box in a box register 1131 \rightarrow Used in section 1129.
 Store maximum values in the hyf table 978* Used in section 977*.
 Store save\_stack[save\_ptr] in eqtb[p], unless eqtb[p] holds a global value 313* Used in section 312.
 Store all current lc\_code values 1668 \ Used in section 1667.
 Store hyphenation codes for current language 1667 Used in section 1014*.
Store the current token, but goto continue if it is a blank space that would become an undelimited
    parameter 427 Used in section 426.
\langle \text{Subtract glue from } break\_width 886 \rangle Used in section 885.
\langle Subtract the width of node v from break_width 889\rangle Used in section 888.
 Suppress expansion of the next token 401^* Used in section 399.
 Swap the subscript and superscript into box x 786 Used in section 781.
 Switch to a larger accent if available and appropriate 784^* Used in section 781.
 Switch to a larger native-font accent if available and appropriate 783 \ Used in section 781.
 Tell the user what has run away and try to recover 368* Used in section 366.
(Terminate the current conditional and skip to \fi 545) Used in section 399.
```

```
\langle \text{ Test box register status 540} \rangle Used in section 536*.
 Test if an integer is odd 539 Used in section 536*.
 Test if two characters match 541 \ Used in section 536*.
 Test if two macro texts match 543 Used in section 542.
 Test if two tokens match 542 Used in section 536*.
 Test relation between integers or dimensions 538 \ Used in section 536*.
 The em width for cur_{-}font 593 Used in section 490.
 The x-height for cur_{-}font 594 Used in section 490.
 Tidy up the parameter just scanned, and tuck it away 434* Used in section 426.
 Transfer node p to the adjustment list 697 Used in section 691.
 Transplant the post-break list 932 \ Used in section 930.
 Transplant the pre-break list 933 \ Used in section 930.
 Treat cur-chr as an active character 1206 \rightarrow Used in sections 1205 and 1209.
 Try the final line break at the end of the paragraph, and goto done if the desired breakpoints have been
    found 921 Vsed in section 911.
(Try to allocate within node p and its physical successors, and goto found if allocation was possible 149)
    Used in section 147*.
Try to break after a discretionary fragment, then goto done 5 917 Used in section 914.
 Try to get a different log file name 570 Used in section 569*.
 Try to hyphenate the following word 943 \ Used in section 914.
 Try to recover from mismatched \right 1246 \right Used in section 1245.
\langle \text{Types in the outer block } 18, 25, 38^*, 105, 113^*, 135^*, 174, 238, 299, 330^*, 583^*, 630, 974^*, 979^*, 1489 \rangle Used in
    section 4*.
 Undump MLTFX-specific data 1702* Used in section 1358*.
 Undump a couple more things and the closing check word 1382* Used in section 1358*.
 Undump constants for consistency check 1363* Used in section 1358*.
 Undump regions 1 to 6 of eqtb 1372^* Used in section 1369^*.
 Undump the \varepsilon-TeX state 1466 \ Used in section 1363*.
 Undump the array info for internal font number k 1378* Used in section 1376*.
 Undump the dynamic memory 1367* Used in section 1358*.
 Undump the font information 1376^* Used in section 1358^*.
 Undump the hash table 1374^* Used in section 1369^*.
 Undump the hyphenation tables 1380* Used in section 1358*.
 Undump the string pool 1365* Used in section 1358*.
 Undump the table of equivalents 1369* Used in section 1358*.
 Update the active widths, since the first active node has been deleted 909 Used in section 908.
 Update the current height and depth measurements with respect to a glue or kern node p 1030 \) Used in
    section 1026.
(Update the current marks for fire_up 1642) Used in section 1068.
 Update the current marks for vsplit 1639 Used in section 1033.
\langle \text{Update the current page measurements with respect to the glue or kern specified by node p 1058} \rangle
    section 1051.
(Update the value of printed_node for symbolic displays 906) Used in section 877.
 Update the values of first\_mark and bot\_mark 1070 \rightarrow Used in section 1068.
 Update the values of last\_glue, last\_penalty, and last\_kern\ 1050 Used in section 1048.
 Update the values of max_h and max_v; but if the page is too large, goto done 679 Used in section 678*.
 Update width entry for spanned columns 846 \ Used in section 844.
 Use code c to distinguish between generalized fractions 1236 \ Used in section 1235.
(Use node p to update the current height and depth measurements; if this node is not a legal breakpoint,
    goto not-found or update_heights, otherwise set pi to the associated penalty at the break 1027 \rangle Used
    in section 1026.
(Use size fields to allocate font information 601) Used in section 597.
```

260 Names of the sections  $X_{\overline{a}}T_{\overline{b}}X$ 

```
 \begin{array}{lll} \langle \mbox{ Wipe out the whatsit node $p$ and $\mbox{goto}$ done $1419$} \rangle & \mbox{ Used in section $228$^*.} \\ \langle \mbox{ Wrap up the box specified by node $r$, splitting node $p$ if called for; set $wait \leftarrow true$ if node $p$ holds a remainder after splitting $1075$ \rangle & \mbox{ Used in section $1074$.} \\ \langle \mbox{ synctex case for $print\_param 1708$^*$} \rangle & \mbox{ Used in section $263$^*.} \end{array}
