NAME

latex, pdflatex, xelatex, lualatex, dvilualatex, cslatex, pdfcslatex, platex, uplatex, lamed – structured text formatting and typesetting

SYNOPSIS

latex [first-line]

DESCRIPTION

This manual page is a mere skeleton.

The LATEX language is described in the book LATEX – A Document Preparation System. LATEX is a TeX macro package, not a modification to the TeX source program, so all the capabilities described in $\mathbf{tex}(1)$ are present.

The LATEX macros encourage writers to think about the content of their documents, rather than the form. The ideal, very difficult to realize, is to have no formatting commands (like "switch to italic" or "skip 2 picas") in the document at all; instead, everything is done by specific markup instructions: "emphasize", "start a section".

The primary source of documentation for LATEX is the LATEX manual referenced below.

lualatex, **pdflatex**, **pdfcslatex**, **xelatex** are LATEX formats based on the respective engines. All output PDF by default.

platex, uplatex are Japanese LATEX formats based on e-pTeX and e-upTeX (DVI output). lamed is the Aleph-based LATEX format (DVI output).

dvilualatex is LuaTeX-based and outputs DVI.

cslatex is csTeX-based (primitives integrated into pdfTeX) and outputs DVI.

On some systems **latex209** and **slitex** may still be available for compatibility with older versions of LATEX. These should not be used for new texts.
