# 1 The French language

The file frenchb.dtx<sup>1</sup>, defines all the language definition macros for the French language.

Customisation for the French language is achieved following the book "Lexique des règles typographiques en usage à l'Imprimerie Nationale" troisième édition (1994), ISBN-2-11-081075-0.

First version released: 1.1 (May 1996) as part of Babel-3.6beta. Version 2.0a was released in February 2007 and version 3.0a in February 2014.

babel-french has been improved using helpful suggestions from many people, mainly from Jacques André, Michel Bovani, Thierry Bouche, Vincent Jalby, Denis Bitouzé, Ulrike Fisher and Marcel Krüger. Thanks to all of them!

LaTeX-2.09 is no longer supported. Version 3.0 has been designed to be used only with LaTeX2e and Plain formats based on TeX, pdfTeX, LuaTeX or XeTeX engines. Changes between version 3.0 and v3.6c are listed in subsection 1.4 p. 12.

An extensive documentation in French (file frenchb-doc.pdf) is now included in babel-french.

# 1.1 Basic interface

In a multilingual document, some typographic rules are language dependent, i.e. spaces before 'high punctuation' (:;!?) in French, others modify the general layout (i.e. layout of lists, footnotes, indentation of first paragraphs of sections) and should apply to the whole document.

The French language can be loaded with Babel by a command like:

\usepackage[german, spanish, french, british] {babel} 2

A variant acadian of french is provided; it is originally identical to french but can be customised independently in terms of patterns, punctuation spacing, captions, etc. Both variants can be used together inside the same document.

babel-french takes account of Babel's main language defined as the last option at Babel's loading. When French is not Babel's main language, babel-french does not alter the general layout of the document (even in parts where French is the current language): the layout of lists, footnotes, indentation of first paragraphs of sections are not customised by babel-french.

When French is loaded as the last option of Babel, babel-french makes the following changes to the global layout, both in French and in all other languages<sup>3</sup>:

- 1. the first paragraph of each section is indented (LaTeX only);
- 2. the default items in itemize environment are set to '—' instead of '•', and all vertical spacing and glue is deleted; it is possible to change '—' to something else ('-' for instance) using \frenchsetup{} (see section 1.2 p. 5);

<sup>&</sup>lt;sup>1</sup>The file described in this section has version number v3.6c and was last revised on 2024-07-25.

<sup>&</sup>lt;sup>2</sup>Always use french as option name for the French language, former aliases frenchb or francais are depreciated; expect them to be removed sooner or later!

<sup>&</sup>lt;sup>3</sup>For each item, hooks are provided to reset standard LaTeX settings or to emulate the behavior of former versions of babel-french (see command \frenchsetup{}, section 1.2 p. 5).

- 3. vertical spacing in general LaTeX lists is shortened;
- 4. footnotes are displayed "à la française".
- 5. the separator following the table or figure number in captions is printed as '–' instead of ':'; for changing this see 1.2.3 p. 10.

Regarding local typography, the command \selectlanguage{french} switches to the French language<sup>4</sup>, with the following effects:

- 1. French hyphenation patterns are made active;
- 2. 'high punctuation' characters (: ; ! ?) automatically add correct spacing <sup>5</sup> in French; this is achieved using callbacks in Lua(La)TeX or 'XeTeXinterchar' mechanism in Xe(La)TeX; with TeX'82 and pdf(La)TeX these four characters are made active in the whole document;
- 3. \today prints the date in French;
- 4. the caption names are translated into French (LaTeX only). For customisation of caption names see section 1.2.2 p. 10.
- 5. the space after \dots is removed in French.

Some commands are provided by babel-french to make typesetting easier:

 French quotation marks can be entered using the command \frquote{}: \frquote{some text} will output « some text ». Former commands \og and \fg are kept for backward compatibility: \og some text\fg{} is an alternative to \frquote{some text}.

If French quote characters are available on your keyboard, you can use them, to get proper spacing in LaTeX2e see option og=«, fg=» p. 8.

For quotations spreading over more than one paragraph, \frquote will add at the beginning of every paragraph of the quotation either an opening French guillemet («), or a closing one (») or nothing depending on option EveryParGuill=open or =close or =none, see p. 9.

The command \NoEveryParQuote is provided to locally suppress unwanted guillemets (typically when lists are embedded in \frquote{}), it is meant to be used inside an environment or a group.

\frquote is recommended to enter embedded quotations "à la française", several variants are provided through options.

• with all engines: the inner quotation is surrounded by double quotes ("texte") unless option <a href="InnerGuillSingle=true">InnerGuillSingle=true</a>, then a) the inner quotation is printed as <a href="texte">texte</a> and b) if the inner quotation spreads over more than one paragraph, every paragraph included in the inner quotation starts with a <a href="texter-year-guill=open">or a</a> or nothing, depending on option <a href="EveryParGuill=open">EveryParGuill=open</a> (default) or <a href="texter-year-guill=open">close</a> or <a href="mailto:none-year-guill=open">none</a>.

<sup>4\</sup>selectlanguage{francais} and \selectlanguage{frenchb} are no longer supported.

<sup>&</sup>lt;sup>5</sup>Well, the automatic insertion may add unwanted spaces in some cases, for correction see AutoSpacePunctuation option and \NoAutoSpacing command p. 7.

with LuaTeX based engines, it is possible to add a French opening or closing guillemet (« or ») at the beginning of every line of the inner quotation using option EveryLineGuill=open or =close; note that with any of these options, the inner quotation is surrounded by French guillemets (« and ») regardless option InnerGuillSingle; the default is EveryLineGuill=none so that \frquote{} behaves as with non-LuaTeX engines.

A starred variant \frquote\* is meant for inner quotations which end together with the outer one: using \frquote\* for the inner quotation will print only one closing quote character (the outer one) as recommended by the French 'Imprimerie Nationale'.

- 2. \frenchdate{<year>}{<month>}{<day>} helps typesetting dates in French: \frenchdate{2001}{01}{01} will print 1<sup>er</sup> janvier 2001 in a box without any linebreak.
- 3. A command \up is provided to typeset superscripts like M\up{me} (abbreviation for "Madame"), 1\up{er} (for "premier"). Other commands are also provided for ordinals: \ier, \iere, \iere, \ieres, \ieme, \iemes (3\iemes prints 3<sup>es</sup>). All these commands take advantage of real superscript letters when they are available in the current font.
- 4. Command \bname{} (boxed name) is provided to typeset family names: its argument will not be hyphenated except on explicit hyphens. \bsc{} (boxed small caps) is a variant that prints its argument in small capitals, it is meant for bibliographies, signatures, etc. Usage: Albert~\bsc{Camus}.
- 5. Commands \primo, \secundo, \tertio and \quarto print 1°, 2°, 3°, 4°. \FrenchEnumerate{6} prints 6°.
- 6. Abbreviations for "Numéro(s)" and "numéro(s)" (N° N° n° and n° s) are obtained via the commands \No, \Nos, \no, \nos.
- 7. Two commands are provided to typeset the symbol for "degré": \degre prints the raw character and \degres should be used to typeset temperatures (e.g., "20~\degres C" with a non-breaking space), or for alcohols" strengths (e.g., "45\degres" with *no* space in French) or for angles in math mode.
- 8. In math mode the comma has to be surrounded with braces to avoid a spurious space being inserted after it, in decimal numbers for instance (see the T<sub>E</sub>Xbook p. 134). The command \DecimalMathComma makes the comma behave as an ordinary character when the current language is French (no space added); as a counterpart, if \DecimalMathComma is active, an explicit thin space has to be added in lists and intervals: \$(x,\,y)\$, \$[0,\,1]\$. \StandardMathComma switches back to the standard behaviour of the comma in French.

The icomma package is an alternative workaround.

- 9. A command \nombre was provided in 1.x versions to easily format numbers in slices of three digits separated either by a comma in English or with a space in French; \nombre is now mapped to \numprint from numprint.sty, which should be loaded after Babel, see numprint.pdf for more information.
- 10. babel-french has been designed to take advantage of the xspace package if present: adding \usepackage{xspace} in the preamble will force macros like \fg, \ier, \ieme, \dots, ..., to respect the spaces you type after them, for instance typing '1\ier juin' will print '1er juin' (no need for a forced space after 1\ier).

### 1.2 Customisation

Customisation of babel-french relies on command \frenchsetup{} (formerly called \frenchsetup{}, the latter name will be kept for ever to ensure backwards compatibility), options are entered using the 13keys syntax. The command \frenchsetup{} is to appear in the preamble only (after loading Babel).

## 1.2.1 \frenchsetup{options}

\frenchbsetup{} and \frenchsetup{} are synonymous; the latter should be preferred as the language name for French in Babel is no longer frenchb but french. \frenchsetup{ShowOptions} prints all available options to the .log file, it is just meant as a remainder of the list of offered options. As usual with 13keys syntax, boolean options (as ShowOptions) can be entered as ShowOptions=true or just ShowOptions, the =true part can be omitted.

The other options are listed below. Their default value is shown between braces, sometimes followed be a '\*'. The '\*' means that the default shown applies when babel-french is loaded as the *last* option of Babel —Babel's *main language*—, and is toggled otherwise.

StandardLayout=true (false\*) forces babel-french not to interfere with the layout: no action on any kind of lists, first paragraphs of sections are not indented (as in English), no action on footnotes; it useless unless French is the main language. This option can be used to avoid conflicts with classes or packages which customise lists or footnotes.

GlobalLayoutFrench=false (true\*) can only be used when French is the main language; setting it to false will emulate what prior versions of babel-french (pre-2.2) did: lists, and first paragraphs of sections will be displayed the standard way in other languages than French, and "à la française" in French (changing the layout inside a document is a bad practice imho). Note that the layout of footnotes is language independent anyway (see below FrenchFootnotes and AutoSpaceFootnotes).

- IndentFirst=false (true\*); set this option to false if you do not want babelfrench to force indentation of the first paragraph of sections. When French is the main language, this option applies to all languages.
- PartNameFull=false (true); when true (the default), babel-french numbers the title of \part{} commands as "Première partie", "Deuxième partie" and so on. With some classes which change the \part{} command (AMS classes do so), you could get "Première partie 1", "Deuxième partie 2" in the toc; when this occurs, this option should be set to false, part titles will then be printed as "Partie I", "Partie II".
- ListItemsAsPar=true (false) setting this option to true is recommended: list items will be displayed as paragraphs with indented labels (in the "Imprimerie Nationale" way) instead of having labels hanging into the left margin. How these two layouts differ is shown below:

Text starting at 'parindent' <= Leftmargin

- first item running on two lines or more...
  - first second level item on two lines...
  - next one…
- second item…

Default French layout

Text starting at 'parindent' <= Leftmargin

- first item running on two lines or more...
  - first second level item
    on two lines...
    - next one…
  - second item...

With ListItemsAsPar=true

- StandardListSpacing=true (false\*) <sup>6</sup>; babel-french usually customises the vertical spaces in the list environment, this affects all lists, including itemize, enumerate, description, but also abstract, quote, quotation, verse, etc. which are based on list. Setting this option to true reverts to the standard settings of the list environment as defined by the document class.
- StandardItemizeEnv=true (false\*); babel-french redefines the itemize environment to suppress any vertical space between items of itemize lists in French and customises left margins. Setting this option to true reverts to the standard definition of itemize.
- StandardEnumerateEnv=true (false\*); babel-french redefines enumerate and description environments to make left margins match those of the French version of itemize lists. Setting this option to true reverts to the standard definition of enumerate and description.
- StandardItemLabels=true (false\*) when set to true this option prevents babelfrench from changing the labels in itemize lists in French.

<sup>&</sup>lt;sup>6</sup>This option should be used instead of former option ReduceListSpacing (kept for backward compatibility) which could be misleading: with some classes (smfart, smfbook f.i.) you had to set ReduceListSpacing=false to revert to the class settings which actually reduce list's spacings even more than babel-french! StandardListSpacing=true replaces ReduceListSpacing=false.

ItemLabels=\textbullet, \textendash, \ding{43}, (\textendash\*); when StandardItemLabels=false (the default), this option enables to choose the label used in French itemize lists for all levels. The next four options do the same but each one for a specific level only. Note that \ding{43} requires loading the pifont package.

```
ItemLabeli=\textbullet, \textendash, \ding{43} (\textemdash*)
ItemLabelii=\textbullet, \textendash, \ding{43} (\textemdash*)
ItemLabeliii=\textbullet, \textendash, \ding{43} (\textemdash*)
ItemLabeliv=\textbullet, \textendash, \ding{43} (\textemdash*)
```

- StandardLists=true (false\*) forbids babel-french to customise any kind of list. The option StandardLists=true should be used in case of conflicts with classes or packages that customise lists too. This option is just a shorthand setting all four options StandardListSpacing=true, StandardItemizeEnv=true, StandardEnumerateEnv=true and StandardItemLabels=true.
- List01dLayout=true (false); starting with version 2.6a, the layout of lists has changed regarding leftmargins' sizes and default itemize label ('—' instead of '-' up to 2.5k). This option, provided for backward compatibility, displays lists as they were up to version 2.5k.
- FrenchFootnotes=false (true\*) reverts to the standard layout of footnotes. By default babel-french typesets leading numbers as '1. ' instead of '1', but has no effect on footnotes numbered with symbols (as in the \thanks command). Two commands \StandardFootnotes and \FrenchFootnotes are available to change the layout of footnotes locally; \StandardFootnotes can help when some footnotes are numbered with letters (inside minipages for instance).
- AutoSpaceFootnotes=false (true\*); by default babel-french adds a (customisable) thin space in the running text before the number or symbol calling the footnote. Making this option false reverts to the standard setting (no space added). The default definition of this thin space is: \newcommand\*{\FBfnmarkspace}{\kern .5\fontdimen2\font}
- AutoSpacePunctuation=false (true); in French, the user should input a space before the four characters ':;!?' but as many people forget about it (even among native French writers!), the default behaviour of babel-french is to automatically typeset non-breaking spaces the width of which is either \FBthinspace (defauts to a thin space) before ';' '!' '?' or \FBcolonspace (defauts to \space) before ':'; the defaults follow the French 'Imprimerie Nationale's recommendations. This is convenient in most cases but can lead to addition of spurious spaces in URLs, in MS-DOS paths or in timetables (10:55) —this no longer occurs with LuaTeX—, except if they are typed in \texttt or verbatim mode. When the current font is a monospaced (typewriter) font, no spurious space is

added in that case <sup>7</sup>, so the default behaviour of of babel-french in that area should be fine in most circumstances.

Choosing AutoSpacePunctuation=false will ensure that a proper space is added before ':;!?' if and only if a (normal) space has been typed in. This option gives full control on space insertion before ':;!?'. Those who are unsure about their typing in this area should stick to the default option and use the provided \NoAutoSpacing command inside a group in case an unwanted space is added by babel-french (i.e. {\NoAutoSpacing http://mysite} or {\NoAutoSpacing ???} (needed for pdfTeX only).

- ThinColonSpace=true (false) changes the non-breaking space added before the colon ':' to a thin space, so that the same amount of space is added before any of the four 'high punctuation' characters. The default setting is supported by the French 'Imprimerie Nationale'.
- OriginalTypewriter=true (false) prevents any customisation of \ttfamily and \texttt{} in French. This option should only be used to ensure backward compatibility. The current default behaviour is to switch off any addition of space before high punctuation with typewriter fonts (e.g. verbatim).
- UnicodeNoBreakSpaces=true (false); (experimental) this option should be set to true only while converting LuaLaTeX files to HTML. It ensures that non-breaking spaces added by babel-french are inserted in the PDF file as U+A0 or U+202F (thin) instead of penalties and glues. Note that lwarp (v. 0.37 and up) is fully compatible with babel-french for translating PDFLaTeX or XeLaTeX files to HTML.
- og=«, fg=»; when guillemets characters are available on the keyboard (through a compose key for instance), it is nice to use them instead of typing \frquote{}. This option tells babel-french which characters are opening and closing French guillemets (they depend on the input encoding), then you can type either « guillemets » or «guillemets» 9 (with or without spaces) to get properly typeset French quotes. This option works with LuaLaTeX, XeLaTeX and with pdfLaTeX (default encoding: utf8); with pdflatex other 8-bits encodings (latin1, latin9, ansinew, applemac,...) are also supported when properly declared with inputenc.
- INGuillSpace=true (false) resets the dimensions of spaces after opening French quotes and before closing French quotes to the French 'Imprimerie Nationale' standards (inter-word space). babel-french's default setting produces slightly narrower spaces with less stretchability.

<sup>&</sup>lt;sup>7</sup>Unless option OriginalTypewriter is set, \ttfamily is redefined in French to switch off space tuning, see below.

<sup>&</sup>lt;sup>8</sup>Actually, this is needed only with the XeTeX and pdfTeX engines. LuaTeX no longer inserts any space in strings like http://mysite, C:\Foo, 10:55...

<sup>&</sup>lt;sup>9</sup>Or even «~guillemets~», but only with LuaLaTeX.

- EveryParGuill=open, close, none (open); sets whether an opening quote («) or a closing one (») or nothing should be printed by \frquote{} at the beginning of every parapraph included in a level 1 (outer) quotation. This option is also considered for level 2 (inner) quotations to decide between < and > when InnerGuillSingle=true (see below).
- EveryLineGuill=open, close, none (none); with LuaTeX based engines only, it is possible to set this option to open [resp. close]; this ensures that a '«' [resp. '»'] followed by a proper space will be inserted at the beginning of every line of embedded (inner) quotations spreading over more than one line (provided that both outer and inner quotations are entered with \frquote{}). When EveryLineGuill=open or =close the inner quotation is always surrounded by « and », the next option is ineffective.
- InnerGuillSingle=true (false); if InnerGuillSingle=false (the default), inner quotations entered with \frquote{} start with `` and end with ''. If
  InnerGuillSingle=true, < and > are used instead of British double quotes;
  moreover if option EveryParGuill=open (or close) is set, a < (or >) is added at
  the beginning of every parapraph included in the inner quotation.
- ThinSpaceInFrenchNumbers=true (false); if numprint has been loaded with the autolanguage option, while typesetting numbers with the \numprint{} command, \npthousandsep is defined as a non-breaking space (~) 10 in French; when set to true, this option redefines \npthousandsep as a thin space (\FBthinspace).
- SmallCapsFigTabCaptions=false (true\*); when set to false, \figurename and \tablename will be printed in French captions as "Figure" and "Table" instead of being printed in small caps (the default). The same result can be achieved by defining \FBfigtabshape as \relax before loading babel-french (in a document class f.i.).
- CustomiseFigTabCaptions=false (true\*); when set to false the default separator (colon) is used instead of \CaptionSeparator. Anyway, babel-french tries hard to insert a proper space before it in French and warns if it fails to do so.
- OldFigTabCaptions=true (false) is to be used *only* when figures' and tables' captions must be typeset as with pre 3.0 versions of babel-french (with \CaptionSeparator in French and colon otherwise). Intended for standard LaTeX classes only.
- FrenchSuperscripts=false (true); then \up=\textsuperscript. (option added in version 2.1). Should only be made false to recompile documents written before 2008 without changes: by default \up now relies on \fup designed to produce better looking superscripts.

<sup>&</sup>lt;sup>10</sup>Actually without stretch nor shrink.

LowercaseSuperscripts=false (true); by default babel-french inhibits the uppercasing of superscripts (for instance when they are moved to page headers). Making this option false will disable this behaviour (not recommended).

SuppressWarning=true (false); can be turned to true if you are bored with babel-french's warnings; use this option as *first* option of \frenchsetup{} to cancel warnings launched by other options.

**Options' order** – Please remember that options are read in the order they appear in the \frenchsetup{} command. Someone wishing that babel-french leaves the layout of lists and footnotes untouched but caring for indentation of first paragraph of sections should choose \frenchsetup{StandardLayout, IndentFirst}
The reverse order \frenchsetup{IndentFirst, StandardLayout} would lead to option IndentFirst being overwritten by StandardLayout.

#### 1.2.2 Caption names

All caption names can easily be customised in French using the simplified syntax introduced by Babel 3.9, for instance \def\frenchproofname{Preuve} or \def\acadianproofname{Preuve} for the acadian dialect. The older syntax \addto\captionsfrench{\def\proofname{Preuve}} still works. Keep in mind that only french can be used to redefine captions, even if Babel's option was entered as frenchb or français.

## 1.2.3 Figure and table captions

In French, captions in figures and tables should never be printed as 'Figure 1: 'which is the default in standard LaTeX2e classes (a space should *always* preceed a colon in French), anyway 'Figure 1 – 'is preferred.

When French is the main language, the default behaviour of babel-french is to change the separator (colon) used in figures' and tables' captions for all languages to \CaptionSeparator which defaults to '-' and can be redefined in the preamble with \renewcommand\*{\CaptionSeparator}{...}. This works for the standard LaTeX2e classes, for the memoir koma-script and beamer classes. In case this procedure fails a warning is issued.

When French is not the main language, the colon is preserved for all languages including French but babel-french tries hard to insert a proper space before it and warns if it fails to do so.

Three options are provided to customise figure and table captions:

 CustomiseFigTabCaptions is set to true when French is the main language (hence separator = ' - ') and to false otherwise (hence separator = ': ' with a proper space before the colon in French if possible); toogle this option if needed;

- the second option, OldFigTabCaptions, can be set to true to print figures' and tables' captions as they were with versions pre 3.0 of babel-french (using \CaptionSeparator in French and colon in other languages); this option only makes sense with the standard LaTeX classes article, report and book;
- the last option, SmallCapsFigTabCaptions, can be set to false to typeset \figurename and \tablename in French as "Figure" and "Table" rather than in small caps (the default).

# 1.3 Hyphenation checks

Once you have built your format, a good precaution would be to perform some basic tests about hyphenation in French. For LaTeX2e I suggest this:

• run pdfLaTeX on the following file:

```
%%% Test file for French hyphenation.
\documentclass[french]{article}
\usepackage[utf8]{inputenc} % utf8, what else?
\usepackage[T1]{fontenc} % mandatory for French
\usepackage{lmodern} % or erewhon, palatino...
\usepackage{babel}
\begin{document}
\showhyphens{signal container \'ev\'enement alg\`ebre}
\showhyphens{signal container événement algèbre}
\end{document}
```

check the hyphenations proposed by TEX in your log-file; in French you should get with both 7-bit and 8-bit encodings
 si-gnal contai-ner évé-ne-ment al-gèbre.
 Do not care about how accented characters are displayed in the log-file, what matters is the position of the '-' hyphen signs only.

If they are all correct, your installation (probably) works fine, if one (or more) is (are) wrong, ask a local wizard to see what's going wrong and perform the test again (or e-mail me about what happens).

Frequent mismatches:

- you get sig-nal con-tainer, this probably means that the hyphenation patterns you are using are for US-English, not for French;
- you get no hyphen at all in évé-ne-ment, this probably means that you are using CM fonts and the macro \accent to produce accented characters. Using 8-bits fonts with built-in accented characters avoids this kind of mismatch.

# 1.4 Changes

#### What's new in version 3.6?

Version 3.6a no longer loads the keyval package, replaced by core LaTeX commands (13keys). The thin space added before footnote's calls is now customisable (suggested by Thomas Savary), the command's name is \FBfnmarkspace.

#### What's new in version 3.5?

Version 3.5a offers a new option **ListItemsAsPar**. The default layout of lists is unchanged (for backward compatibility), but users should try this new option which ensures a layout of lists closer to French typographic standards: see f.i. how lists are typeset in the book "Lexique des règles typographiques en usage à l'Imprimerie Nationale".

Version 3.5b fixes a bug due to wrong \everypar's management in \frquote{}; it showed up when \frquote{} immediately followed a sectionning command. Starting with version 3.5d, a new option StandardListSpacing has been added to supersede ReduceListSpacing.

A new command \NoEveryParQuote has been added in version 3.5e: it is meant to be used inside a group or environment to suppress unwanted guillemets (typically when lists are embedded in \frquote{}).

Version 3.5g fixes a long standing bug affecting LuaTeX: legacy kerning was disabled for Type1 fonts since v3.1g (2015).

Version 3.5j also fixes a long standing bug affecting koma-script, memoir and beamer classes: redefintions of the caption separator (commands \captionformat, \captiondelim, etc.) are now taken into account properly.

Version 3.5k is a cleanup release:

- the translations in French of \figurename and \tablename no longer hold font changing commands (switch to small caps), the font switch has been moved to \fnum@figure and \fnum@table as suggested by Axel Sommerfeldt.
- Package caption can now be loaded whether before or after babel, indifferently.
- \pdfstringdefDisableCommands is no longer used: as suggested by the La-TeX3 team, all commands requiring special care in hyperref's bookmarks are now defined using \textorpdfstring{}{}.

Version 3.5n introduces a new command \bname{} (an alternative to \bsc{}). Version 3.5q corrects a bug in lists layout: \listparindent (formely 0pt) is defined as \parindent and if \parskip > 0pt, \parsep is now defined as \parskip. This ensures that paragraphs included in lists are now visible. The former behaviour can be recovered by adding \parskip=0pt, \parindent=0pt inside the list environment. Version 3.5r is compatible with ucharclasses which is now loaded by fontsetup with the XeTeX engine. The frenchb.ins file is no longer needed to extract the .ldf files from frenchb.dtx (see README.md).

# What's new in version 3.4?

Version 3.4a adds a new command \frenchdate (see p. 4) and slightly changes number formatting: \FBthousandsep is now a kern instead of a rubber length. \renewcommand\*{\FBthousandsep}{~} will switch back to the former (wrong) behaviour.

Both options french and acadian can now be used simultaneously in a document; currently french and acadian are identical, it is up to the user to customise acadian in terms of hyphenation patterns, captionnames, date format or high punctuation and quotes spacing if he/she needs a variant for French.

A new command \FBsetspaces has been added for easy customising of spacing before high punctuation and inside quotes independently for french and acadian, see p. 18.

Version 3.4 requires eTeX and LuaTeX 1.0.4 or newer.

#### What's new in version 3.3?

In version 3.3d the automatic insertion of non-breaking spaces before the colon character has been improved with engine LuaTeX only: a spurious space is no longer inserted in strings like http://mysite, C:\Program Files or 10:55. Unfortunately, my attempts to do the same with XeTeX or pdfTeX were unsuccessful.

A few internal changes have been made in version 3.3c to improve the convertion into HTML of non-breaking spaces added by babel-french. Usage of lwarp (v.0.37 and up) is recommended for HTML output, it works fine on files compiled with XeLaTeX or pdfLaTeX formats. A new experimental option UnicodeNoBreakSpaces has been added for LuaLaTeX in version 3.3c, see p. 8.

According to current Babel's standards, every dialect should have it's own .ldf file; starting with version 3.3b, the main support for French is in french.ldf, portmanteau files frenchb.ldf,francais.ldf, acadian.ldf and canadien.ldf have been added. Recommended options are french or acadian, all other are deprecated. BTW, options french and acadian are currently strictly identical.

Release 3.3a is compatible with LuaTeX v. 0.95 (TL2016) and up. Former skips \FBcolonskip, \FBthinskip and \FBguillskip controlling punctuation spacings in LuaTeX have been removed; all three engines now rely on the same commands \FBcolonspace, \FBthinspace and \FBguillspace.

An alias \frenchsetup{} for \frenchbsetup{} has been added in version 3.3a, it might appear more relevant in the future as the language name frenchb should vanish.

Further customisation of the \part{} command is provided via three new commands \frenchpartfirst, \frenchpartsecond and \frenchpartnameord.

# 2 The code

# 2.1 Initial setup

The macro \LdfInit takes care of preventing that this file is loaded more than once (even if both options french and acadian are used in the same document), checking the category code of the @ sign, etc.

```
1 <* french>
2 \LdfInit\CurrentOption{FBclean@on@exit}
```

Let's provide a substitute for \PackageError, \PackageWarning and \PackageInfo not defined in Plain:

```

\iffBunicode French hyphenation patterns are now coded in Unicode, see file hyph-fr.tex. XeTeX \iffBLuaTeX and LuaTeX engines require some extra code to deal with the French "apostrophe". \iffBXeTeX Let's define three new 'if': \iffBLuaTeX, \iffBXeTeX and \iffBunicode which will be true for XeTeX and LuaTeX engines and false for 8-bits engines.

```
80 \newif\iffBunicode
81 \newif\iffBLuaTeX
82 \newif\iffBLuaTeX
82 \newif\iffBXeTeX
83 \begingroup\expandafter\expandafter\expandafter\endgroup
84 \expandafter\ifx\csname luatexversion\endcsname\relax
85 \else
86 \fBunicodetrue \fBLuaTeXtrue
87 \fi
88 \begingroup\expandafter\expandafter\expandafter\endgroup
89 \expandafter\ifx\csname XeTeXrevision\endcsname\relax
90 \else
91 \fBunicodetrue \fBXeTeXtrue
92 \fi
```

\iffBfrench True when the current language is French or any of its dialects; will be set to true by \extrasfrench and to false by \noextrasfrench. Used in \DecimalMathComma and frenchsetup{og=«, fg=»}.

93 \newif\ifFBfrench

\extrasfrench The macro \extrasfrench will perform all the extra definitions needed for the \noextrasfrench French language. The macro \noextrasfrench is used to cancel the actions of \extrasfrench.

In French, character "apostrophe" (U+27 or U+2019) is a letter in expressions like 1'ambulance (French hyphenation patterns provide entries for this kind of words). This means that the \lccode of "apostrophe" has to be non null in French for proper hyphenation of those expressions, and has to be reset to null when exiting French.

The following code ensures correct hyphenation of words like d'aventure, l'utopie, with all TeX engines (XeTeX, LuaTeX, pdfTeX) using hyph-fr.tex patterns.

```
94 \def\extrasfrench{%
        \FBfrenchtrue
95
        \babel@savevariable{\lccode"27}%
96
        \1ccode"27="27
97
        \ifFBunicode
98
          \babel@savevariable{\lccode"2019}%
99
          \1ccode"2019="2019
100
        \fi
101
102 }
103 \def\noextrasfrench{\FBfrenchfalse}
```

One more thing \extrasfrench needs to do is to make sure that "Frenchspacing" is in effect. \noextrasfrench will switch "Frenchspacing" off again if necessary.

```
104 \addto\extrasfrench{\bbl@frenchspacing}
105 \addto\noextrasfrench{\bbl@nonfrenchspacing}
```

## 2.2 Punctuation

As long as no better solution is available, the 'high punctuation' characters (; !? and:) have to be made \active for an automatic control of the amount of space to be inserted before them. Both XeTeX and LuaTeX provide an alternative to active characters ('XeTeXinterchar' mechanism and LuaTeX's callbacks).

\ifFB@active@punct Three internal flags are needed for the three different techniques used for 'high punctuation' management.

```
106 \newif\ifFB@active@punct \FB@active@puncttrue
```

\iffB@luatex@punct With LuaTeX, starting with version 1.0.4, callbacks are used to get rid of active punctuation. With previous versions, 'high punctuation' characters remain active (see below).

```
107 \newif\ifFB@luatex@punct
108 \ifFBLuaTeX
    \ifnum\luatexversion<100
109
       \ifx\PackageWarning\Qundefined
110
         \fb@warning{Please upgrade LuaTeX to version 1.0.4 or above!\\%
111
112
            babel-french will make high punctuation characters (;:!?)\\%
            active with LuaTeX < 1.0.4.}%
113
       \else
114
         \PackageWarning{french.ldf}{Please upgrade LuaTeX
115
            to version 1.0.4 or above!\MessageBreak
116
            babel-french will make high punctuation characters%
117
            \MessageBreak (;:!?) active with LuaTeX < 1.0.4;%
118
            \MessageBreak reported}%
119
```

\ifFB@xetex@punct For XeTeX, the availability of \XeTeXinterchartokenstate decides whether the 'high punctuation' characters (; ! ? and :) have to be made \active or not.

The number of available character classes has been increased from 256 to 4096 in XeTeX v. 0.99994, the class for non-characters is now 0xFFF=4095 (formerly 0xFF=255). The class for standard characters is 0.

```
125 \newcount\FB@stdchar
126 \newif\ifFB@xetex@punct
127\ifdefined\XeTeXinterchartokenstate
    \FB@xetex@puncttrue\FB@active@punctfalse
     \ifdim\the\XeTeXversion\XeTeXrevision\p@ < 0.99994\p@
129
       \chardef\FB@nonchar="FF \relax
130
    \else
131
       \chardef\FB@nonchar="FFF \relax
132
    \fi
133
    FB@stdchar=\z@
134
135 \fi
```

\FBguillspace These three commands are meant for basic French. Other French dialects can use \FBcolonspace different settings, see below. According to the I.N. specifications, the ':' requires \FBthinspace an inter-word space before it, the other three require just a thin space. We define

\FBcolonspace as \space (inter-word space) and \FBthinspace as an half inter-word space with no shrink nor stretch. \FBguillspace is defined btw. as spacing for French quotes is handled together with high punctuation for LuaTeX and XeTeX. \FBguillspace has been fine tuned by Thierry Bouche to 80% of an inter-word space with reduced stretchability. All three are user customisable in the preamble, best using the \FBsetspaces command described below. A penalty will be added before these spaces to prevent line breaking.

\FBsetspaces This command makes it easy to fine tune \FBguillspace, \FBcolonspace and \FBthinspace in French (defaut) or independently in a French dialect using the optional argument. They are meant for LaTeX2e only and can only be used in the preamble. Four mandatory arguments are expected besides the optional one: the first one is a string either "guill", "colon", or "thin", the last four are decimal numbers specifying width, stretch and shrink relative to fontdimens. For instance

\FBsetspaces[acadian]{colon}{0.5}{0}{0} defines \acadianFBcolonspace as a thinspace which will be used for the Acadian dialect only. When used without optional argument or with argument 'french', the same command would tune the basic \FBcolonspace command.

```
141\ifLaTeXe
142 \newcommand*{\FBsetspaces}[5][french]{%
143 \def\bbl@tempa{french}\def\bbl@tempb{#1}%
144 \ifx\bbl@tempa\bbl@tempb \def\bbl@tempb{}fi
145 \@namedef{\bbl@tempb FB#2space}{\hskip #3\fontdimen2\font
146 plus #4\fontdimen3\font
147 minus #5\fontdimen4\font \relax}%
```

With option "acadian", fill the corresponding LuaTeX table. All unset values in the "acadian" subtables will be filled 'AtBeginDocument' by \set@glue@table with the value available for "french".

```
148
       \ifFB@luatex@punct
         \ifx\bbl@tempb\FB@acadian
149
150
            \directlua{
              FBsp.#2.gl.ac[1] = #3
151
              FBsp.#2.gl.ac[2] = #4
152
              FBsp.#2.gl.ac[3] = #5
153
              if \#3 > 0.6 then
154
                 FBsp.\#2.ch.ac = 0xA0
155
              elseif \#3 > 0.2 then
156
                 FBsp.\#2.ch.ac = 0x202F
157
158
                 FBsp.\#2.ch.ac = 0x200B
159
160
              end
            }%
161
         \fi
162
       \fi
163
164
     }
     \@onlypreamble\FBsetspaces
165
166 \fi
```

Remember that the same \extrasfrench command is executed when switching to French or to a French dialect (Acadian). Acadian and French may share the same patterns (or not), and may use different spacing for high punctuation and/or quotes. Basically, for pdfLaTeX and XeLaTeX, the spacing is set for French, then potentially tuned differently for Acadian. LuaTeX relies on an attribute \FB@dialect to decide what spacing is needed for French or Acadian (see LuaTeX table FBsp). As a rough test on \languagename would be unreliable to set the value of \FB@dialect (see babel.pdf), we use a trick based on \detokenize; another option would be to use the \IfLanguageName command from Oberdiek's package iflang.

```
167 \ifLaTeXe
168 \addto\extrasfrench{%
```

```
169 \iffB@luatex@punct
170 \edef\bbl@tempa{\detokenize\expandafter{\languagename}}%
171 \edef\bbl@tempb{\detokenize{french}}%
172 \ifx\bbl@tempa\bbl@tempb \FB@dialect=\z@
173 \else \FB@dialect=\@ne
174 \fi
```

When first entering French, we must set the LuaTeX tables for French (\FB@dialect=0) before any dialect redefines any \FB...space command. Doing this 'AtBeginDocument' would be too late: if French or a French dialect is the main language, \extrasfrench has been executed before!

```
175 \ifdefined\FB@once\else
176 \set@glue@table{colon}%
177 \set@glue@table{thin}%
178 \set@glue@table{guill}%
179 \def\FB@once{}%
180 \fi
181 \fi
```

Any dialect dependent customisation done using \FBsetspaces[dialect] command or alike is now taken into account: the value of \FBthinspace (meant for French, i.e.\FB@dialect=0) is first saved then changed (for Acadian).

```
\ifcsname\languagename FBthinspace\endcsname
182
          \babel@save\FBthinspace
183
          \renewcommand*{\FBthinspace}{%
184
                  \csname\languagename FBthinspace\endcsname}%
185
186
       \fi
Same for \FBcolonspace:
        \ifcsname\languagename FBcolonspace\endcsname
          \babel@save\FBcolonspace
188
          \renewcommand*{\FBcolonspace}{%
189
                  \csname\languagename FBcolonspace\endcsname}%
190
       \fi
191
And for \FBguillspace:
        \ifcsname\languagename FBguillspace\endcsname
192
          \babel@save\FBguillspace
193
          \renewcommand*{\FBguillspace}{%
194
195
                  \csname\languagename FBguillspace\endcsname}%
196
        \fi
     }
197
198\fi
```

The conditional \ifFB@spacing will be used by pdfTeX and XeTeX engines to switch on or off space tuning before high punctuation and inside French quotes. A matching attribute will be defined later for LuaTeX.

```
199 \newif\ifFB@spacing \FB@spacingtrue
```

\FB@spacing@off Two internal commands to switch on and off all space tuning for all six characters \FB@spacing@on ';:!?«»'. They will be triggered by user command \NoAutoSpacing and by font family switching commands \ttfamilyFB \rmfamilyFB and \sffamilyFB. These four commands will now behave the same with any engine (up to version 3.2b, results were engine dependent).

```
200 \iffB@luatex@punct
201 \newcommand*{\FB@spacing@on}{\FB@spacing=\@ne}
202 \newcommand*{\FB@spacing@off}{\FB@spacing=\z@}
203 \else
204 \newcommand*{\FB@spacing@on}{\FB@spacingtrue}
205 \newcommand*{\FB@spacing@off}{\FB@spacingfalse}
206 \fi
```

#### 2.2.1 Punctuation with LuaTeX

The following part holds specific code for punctuation with modern LuaTeX engines, i.e. version 1.0.4 (included in TL2017) or newer.

```
207\iffB@luatex@punct
208 \ifdefined\newluafunction\else
```

This code is for Plain: load 1tluatex.tex if it hasn't been loaded before Babel.

```
209 \input ltluatex.tex
210 \fi
```

We define five LuaTeX attributes to control spacing in French and/or Acadian for 'high punctuation' and quotes, making sure that \newattribute is defined.

\FB@spacing=0 switches off any space tuning both before high punctuation characters and inside French quotes (i.e. function french\_punctuation doesn't alter the node list at all).

\FB@addDPspace=0 switches off automatic insertion of spaces before high punctuation characters (but typed spaces are still turned into non-breaking thin- or word-spaces). \FB@addGUILspace will be set to 1 by option og=«, fg=», thus enabling automatic insertion of proper spaces after '«' and before '»'.

\FB@ucsNBSP triggers the replacement of glues by characters, it is controlled by option UnicodeNoBreakSpaces.

\FB@dialect is 0 for French and 1 for Acadian; its value controls which parts of the glue table (.fr or .ac) are taken into account.

```
\newattribute\FB@spacing
                                    \FB@spacing=\@ne
     \newattribute\FB@addDPspace
                                    \FB@addDPspace=\@ne
212
     \newattribute\FB@addGUILspace \FB@addGUILspace=\z@
213
     \newattribute\FB@ucsNBSP
                                    \FB@ucsNBSP=\z@
214
     \newattribute\FB@dialect
                                    \FB@dialect=\z@
215
    \ifLaTeXe
216
       \PackageInfo{french.ldf}{No need for active punctuation
217
                    characters\MessageBreak with this version
218
```

The next command will be used in the first call of \extrasfrench to convert \FBcolonspace, \FBthinspace and \FBguillspace into a table usable by LuaTeX. This way, any customisation done in the preamble (by \frenchsetup{}, redefinitions or \FBsetspaces commands) are taken into account. Values not explicitly set for Acadian by \FBsetspaces[acadian] commands are copied from the French ones.

In case parsing by the Lua function FBget\_glue (defined in file frenchb.lua) fails due to unexpected syntax in \FB...space the table remains unchanged and a warning is issued. The matching space characters for option UnicodeNoBreakSpaces are set as word space, thin space or null space according to the width parameter.

```
\newcommand*{\set@glue@table}[1]{%
       \directlua {
225
         local s = token.get_meaning("FB#1space")
226
         local t = FBget_glue(s)
227
         if t then

               '*** french.ldf warning: Consider using FBsetspaces to ')
250
            texio.write('term and log', 'customise FB#1space.')
251
            texio.write_nl('term and log', '')
252
         end
253
       }%
254
```

```
255 }
256\fi
257</french>
```

frenchb.lua (env.) This is frenchb.lua. It holds Lua code to deal with 'high punctuation' and quotes.

This code is based on suggestions from Paul Isambert.

First we define two flags to control spacing before French 'high punctuation' (thin space or inter-word space).

Managing spacing after '«' (U+00AB) and before '»' (U+00BB) can be done by the way; we define two flags, FB\_punct\_left for characters requiring some space before them and FB\_punct\_right for '«' which must be followed by some space. In case LuaTeX is used to output T1-encoded fonts instead of OpenType fonts, codes 0x13 and 0x14 have to be added for '«' and '»'.

```
265 local FB_punct_left =
    {[string.byte("!")] = true,
      [string.byte("?")] = true,
267
      [string.byte(";")] = true,
268
      [string.byte(":")] = true,
269
      [0x14]
270
                          = true,
      [0xBB]
                          = true}
271
272 local FB_punct_right =
     {[0x13]
                          = true,
      [0xAB]
                          = true}
```

Two more flags will be needed to avoid spurious spaces in strings like!! ?? or (?)

or if the user has typed a non-breaking space U+00A0 or U+202F (thin) before a 'high punctuation' character: no space should be added by babel-french. Same is true inside French guotes.

```
280 [0xA0] = true,

281 [0x202F] = true}

282 local FB_guil_null =

283 {[0xA0] = true,

284 [0x202F] = true}
```

Local definitions for nodes:

```
285 local new_node
                       = node.new
286 local copy_node
                      = node.copy
287 local node_id
                       = node.id
288 local HLIST
                      = node_id("hlist")
                       = node_id("temp")
289 local TEMP
290 local DISC
                      = node_id("disc")
291 local KERN
                      = node_id("kern")
292 local GLUE
                      = node_id("glue")
                      = node_id("glyph")
293 local GLYPH
294 local PENALTY
                      = node_id("penalty")
295 local nobreak
                      = new_node(PENALTY)
296 nobreak.penalty
                      = 10000
                       = new_node(GLYPH)
297 local nbspace
298 local insert_node_before = node.insert_before
299 local insert_node_after = node.insert_after
300 local remove_node
                             = node.remove
```

Commands \FBthinspace, \FBcolonspace and \FBguillspace are converted 'AtBeginDocument' by the next function FBget\_glue into tables of three values which are fractions of \fontdimen2, \fontdimen3 and \fontdimen4. If parsing fails due to unexpected syntax, the function returns *nil* instead of a table.

```
301 function FBget_glue(toks)
    local t = nil
302
    local f = string.match(toks,
303
                             "[^%w]hskip%s*([%d%.]*)%s*[^%w]fontdimen 2")
304
    if f = "" then f = 1 end
305
306
     if tonumber(f) then
        t = \{tonumber(f), 0, 0\}
307
        f = string.match(toks,
308
                                    "plus%s*([%d%.]*)%s*[^%w]fontdimen 3")
        if f = "" then f = 1 end
309
        if tonumber(f) then
310
           t[2] = tonumber(f)
311
           f = string.match(toks, "minus%s*([%d%.]*)%s*[^%w]fontdimen 4")
312
           if f = "" then f = 1 end
313
314
           if tonumber(f) then
              t[3] = tonumber(f)
315
316
        end
317
     elseif string.match(toks, "[^%w]F?B?thinspace") then
318
        t = \{0.5, 0, 0\}
319
     elseif string.match(toks, "[^%w]space") then
320
        t = \{1, 1, 1\}
321
     end
322
    return t
323
324 end
```

Let's initialize the global LuaTeX table FBsp: it holds the characteristics of the glues used in French and Acadian for high punctuation and quotes and the corresponding no-breaking space characters for option UnicodeNoBreakSpaces.

```
325 FBsp = {}
326 FBsp.thin = {}
327 FBsp.thin.gl = {}
328 FBsp.thin.gl.fr = \{.5, 0, 0\}; FBsp.thin.gl.ac = \{\}
329 FBsp.thin.ch = {}
330 FBsp.thin.ch.fr = 0x202F
                                    ; FBsp.thin.ch.ac = nil
331 FBsp.colon = {}
332 FBsp.colon.gl = {}
333 FBsp.colon.gl.fr = { 1, 1, 1}; FBsp.colon.gl.ac = {}
334 FBsp.colon.ch = {}
335 FBsp.colon.ch.fr = 0xA0
                                    ; FBsp.colon.ch.ac = nil
336 FBsp.guill = {}
337 FBsp.guill.gl = {}
338 FBsp.guill.gl.fr = {.8, .3, .8}; FBsp.guill.gl.ac = {}
339 FBsp.guill.ch = {}
340 FBsp.guill.ch.fr = 0xA0
                                    ; FBsp.guill.ch.ac = nil
```

The next function converts the glue table returned by function FBget\_glue into sp for the current font; beware of null values for fid, see \nullfont in TikZ, and of special fonts like lcircle1.pfb for which font.getfont(fid) does not return a proper font table, in such cases the function returns nil.

```
341 local font_table = {}
342 local function new_glue_scaled (fid, table)
     if fid > 0 and table[1] then
343
        local fp = font_table[fid]
344
        if not fp then
345
           local ft = font.getfont(fid)
346
           if ft then
347
              font_table[fid] = ft.parameters
348
349
              fp = font_table[fid]
           end
350
        end
351
        local gl = new_node(GLUE,0)
352
        if fp then
353
           node.setglue(gl, table[1]*fp.space,
354
                             table[2]*fp.space_stretch,
355
                              table[3]*fp.space_shrink)
356
           return gl
357
        else
358
           return nil
359
        end
360
     else
361
        return nil
362
```

```
363 end 364 end
```

Let's catch LuaTeX attributes \FB@spacing, \FB@addDPspace and \FB@addGUILspace.

```
365 local FBspacing = luatexbase.attributes['FB@spacing']
366 local addDPspace = luatexbase.attributes['FB@addDPspace']
367 local addGUILspace = luatexbase.attributes['FB@addGUILspace']
368 local FBucsNBSP = luatexbase.attributes['FB@ucsNBSP']
369 local FBdialect = luatexbase.attributes['FB@dialect']
370 local has_attribute = node.has_attribute
```

The following function will be added to kerning callback. It catches all nodes of type GLYPH in the list starting at head and checks the language attributes of the current glyph: nothing is done if the current language is not French and only specific punctuation characters (those for which FB\_punct\_left or FB\_punct\_right is true) need a special treatment. In French, local variables are defined to hold the properties of the current glyph (item) and of the previous one (prev) or the next one (next). Constants FR\_fr (french) and FR\_ca (acadian) are defined by command \activate@luatexpunct.

```
371 -- Main function (to be added to the kerning callback).
372 local function french_punctuation (head)
```

Restore the built-in kerning for 8-bits fonts.

```
node.kerning(head)
for item in node.traverse_id(GLYPH, head) do
local lang = item.lang
local char = item.char
```

Skip glyphs not concerned by French kernings.

```
if (lang = FR_fr or lang = FR_ca) and
            (FB_punct_left[char] or FB_punct_right[char]) then
378
          local fid = item.font
379
          local attr = item.attr
380
          local FRspacing = has_attribute(item, FBspacing)
381
          FRspacing = FRspacing and FRspacing > 0
382
          local FRucsNBSP = has_attribute(item, FBucsNBSP)
383
          FRucsNBSP = FRucsNBSP and FRucsNBSP > 0
384
          local FRdialect = has_attribute(item, FBdialect)
385
          FRdialect = FRdialect and FRdialect > 0
386
          local SIG = has_attribute(item, addGUILspace)
387
          SIG = SIG and SIG >0
388
          if FRspacing and fid > 0 then
389
             if FB_punct_left[char] then
390
                local prev = item.prev
391
                local prev_id, prev_subtype, prev_char
392
                if prev then
393
                   prev_id = prev.id
394
```

If the previous node is a glue, check its natural width, only positive glues (actually glues > 1 sp, for tabular 'l' columns) are to be replaced by a non-breaking space.

```
doo     local is_glue = prev_id == GLUE
do1     local glue_wd
do2     if is_glue then
do3         glue_wd = prev.width
do4     end
do5     local realglue = is_glue and glue_wd > 1
```

For characters for which FB\_punct\_thin or FB\_punct\_thick is *true*, the amount of spacing to be typeset before them is controlled by commands \FBthinspace and \FBcolonspace respectively. Two options: if a space has been typed in before (turned into *glue* in the node list), we remove the *glue* and add a nobreak penalty and the required *glue*. Otherwise (auto option), the penalty and the required *glue* are inserted if attribute \FB@addDPspace is set, unless any of these four conditions is met: a) node is ':' and the next one is of type GLYPH (avoids spurious spaces in http://mysite, C:\ or 10:35); b) the previous character is part of type FB\_punct\_null (avoids spurious spaces in strings like (!) or ??); c) a null glue (actually <= 1 sp for tabulars, possibly < 0) preceeds the punctuation character (for tabulars and listings); d) the punctuation character starts a paragraph or an \hbox{}

When option UnicodeNoBreakSpaces is set to true, a Unicode character U+00A0 or U+202F is inserted instead of penalty and glue.

```
if FB_punct_thin[char] or FB_punct_thick[char] then
406
                   local SBDP = has_attribute(item, addDPspace)
407
                   local auto = SBDP and SBDP > 0
408
                   if FB_punct_thick[char] and auto then
409
                       local next = item.next

459
                           insert_node_before(head,item,copy_node(fbglue))
460
461
                        end
462
```

 $(prev_id = TEMP)$  then

424

Let's consider '»' now (the only remaining glyph of FB\_punct\_left class): we just have to remove any *glue* possibly preceding '»', then to insert the nobreak penalty and the proper *glue* (controlled by \FBguillspace). This is done only if French quotes have been 'activated' by options og=«, fg=» in \frenchsetup{} and can be denied locally with \NoAutoSpacing (this is controlled by the SIG flag). If either a) the pre-

ceding glyph is member of FB\_guil\_null, or b) '»' is the first glyph of an \hbox{} or a paragraph, nothing is done, this is controlled by the addgl flag.

```
elseif SIG then
463
                    local addgl = (prev_char and
464
                                    not FB_guil_null[prev_char])
465
466
                                   (not prev_char and
467
                                    prev_id ~= TEMP and
468
                                    not (prev_id == HLIST and
469
                                         prev_subtype = 3)
470
                                   )
471
```

Correction for tabular 'c' (glue 0 plus 1 fil) and 'l' (glue 1sp) columns:

```
if is_glue and glue_wd \leq 1 then
472
473
                       addql = false
474
                    local t = FBsp.guill.gl.fr
475
                    nbspace.char = FBsp.guill.ch.fr
476
                    if FRdialect then
477
                       t = FBsp.guill.gl.ac
478
                       nbspace.char = FBsp.guill.ch.ac
479
                    end
480
                    local fbglue = new_glue_scaled(fid, t)
481
                    if addgl and fbglue then
482
                       if is_glue then
483
                          head = remove_node(head,prev,true)
484
                       end
485
                       if (FRucsNBSP) then
486
                          nbspace.font = fid
487
                          nbspace.attr = attr
488
                          insert_node_before(head,item,copy_node(nbspace))
489
                       else
490
                          nobreak.attr = attr
491
492
                          fbglue.attr = attr
                          insert_node_before(head,item,copy_node(nobreak))
493
                          insert_node_before(head,item,copy_node(fbglue))
494
495
                       end
                    end
496
497
                end
```

Similarly, for '«' (unique member of the FB\_punct\_right class): unless either a) the next glyph is member of FB\_guil\_null, or b) '«' is the last glyph of an \hbox{} or a paragraph (then the addgl flag is false, nothing is done), we remove any *glue* possibly following it and insert first the proper *glue* then a nobreak penalty so that finally the penalty preceeds the *glue*.

```
elseif SIG then
local next = item.next
```

```
local next_id, next_subtype, next_char, nextnext, kern_wd
500
501
                 if next then
                    next_id = next.id
502
503
                    next_subtype = next.subtype
In case of coding «~ remove the penalty and the glue:
                    if next_id == PENALTY then
504
                       nextnext = next.next
505
                        if nextnext and nextnext.id == GLUE then
506
                           head = remove_node(head,nextnext,true)
507
                           head = remove_node(head,next,true)
508
                           next = item.next
509
510
                           if next then
                              next_id = next.id
511
512
                              next_subtype = next.subtype
                              if next_id = GLYPH then
513
                                 next_char = next.char
514
                              end
515
                          end
516
                        end
517
                    end
518
A kern0 might hide a penalty and/or glue, so look ahead if next is a kern (this occurs
```

with « \texttt{a} » and «~\texttt{a}~»):

```
if next_id == KERN then
519
520
                       kern_wd = next.kern
                       if kern_wd = 0 then
521
                          nextnext = next.next
522
                          if nextnext then
523
                             next = nextnext
524
                             next_id = nextnext.id
525
                             next_subtype = nextnext.subtype
526
                             if next_id == PENALTY then
527
528
                                 nextnext = next.next
                                 if nextnext and nextnext.id = GLUE then

                       head = remove_node(head,next,true)
565
                    end
566
                    if (FRucsNBSP) then
567
                       nbspace.font = fid
568
                       nbspace.attr = attr
569
                       insert_node_after(head, item, copy_node(nbspace))
570
                    else
571
                       nobreak.attr = attr
572
                       fbglue.attr = attr
573
574
                       insert_node_after(head, item, copy_node(fbglue))
                       insert_node_after(head, item, copy_node(nobreak))
575
                    end
576
                end
577
             end
578
          end
579
       end
580
    end
581
582
     return head
583 end
584 return french_punctuation
```

```
585 </lua>
```

As a language tag is part of glyph nodes in LuaTeX, no more switching has to be done in \extrasfrench, setting the dialect attribute has already be done (see above, p. 19). The next definition will be used to activate Lua punctuation: it loads frenchb.lua and adds function french\_punctuation to the kerning callback; "adding" anything actually disables the built-in kerning for Type1 fonts (which is now added to french\_punctuation).

```
586 <*french>
587\ifFB@luatex@punct
    \def\activate@luatexpunct{%
       \directlua{%
589
         FR_fr = \the\l@french ; FR_ca = \the\l@acadian ;
590

            texio.write_nl('**************************)
600
601
            texio.write_nl('')
         end
602
        }%
603
604 }
605\fi
```

End of specific code for punctuation with LuaTeX engines.

## 2.2.2 Punctuation with XeTeX

If \XeTeXinterchartokenstate is available, we use the "inter char" mechanism to provide correct spacing in French before the four characters; ! ? and :. The basis of the following code was borrowed from the polyglossia package, see gloss-french.ldf. We use the same mechanism for French quotes (« and »), when automatic spacing for quotes is required by options og=« and fg=» in \frenchsetup{} (see section 2.11). Unless ucharclass is loaded, the default value for \XeTeXcharclass is 0 for characters tokens and \FB@nonchar for all other tokens (glues, kerns, math and box boundaries, etc.). ucharclass defines a XeTeX class for every range of Unicode characters in order to facilitate font switching. Most French characters belong to range ["20, "7F] (class \BasiclatinClass) some (accented chars, diacritics,...) to range ["80, "FF] (class \LatinSupplementClass) and three (\omega, \omega, and the long-s) to ["100, "17F] (class \LatinExtendedAClass).

We check AtBeginDocument whether ucharclass is loaded; if so, when switching to French, the class \FB@stdchar of all characters possibly used in French (except punctuation) will be forced to \BasicLatinClass which is the default for most of them, the class of the others (accented chars, ligatures, diacritics, etc.) will be saved and changed locally in French, then restored to their original value when leaving French.

We switch \XeTeXinterchartokenstate to 1 and change the \XeTeXcharclass values of;!?:(] « and » when entering French. Their inital values will be restored when leaving French.

The following part holds specific code for punctuation with XeTeX engines.

```
606 \ifFB@xetex@punct
607
     \ifLaTeXe
       \PackageInfo{french.ldf}{No need for active punctuation
608
                                 characters\MessageBreak with this
609
                                 version of XeTeX!\MessageBreak reported}
610
     \else
611
       \fb@info{No need for active punctuation characters\\
612
                with this version of XeTeX!}
613
    \fi
614
```

Six new character classes are defined for babel-french.

```
    \newXeTeXintercharclass\FB@punctthick
    \newXeTeXintercharclass\FB@punctthin
    \newXeTeXintercharclass\FB@punctnul
    \newXeTeXintercharclass\FB@guilo
    \newXeTeXintercharclass\FB@guilf
    \newXeTeXintercharclass\FB@guilnul
```

As \babel@savevariable doesn't work inside a \bbl@for loop, we define a variant to save the \XeTeXcharclass values which will be modified in French.

```
621 \def\FBsavevariable@loop#1#2{\begingroup
622 \toks@\expandafter{\originalTeX #1}%
623 \edef\x{\endgroup
624 \def\noexpand\originalTeX{\the\toks@ #2=\the#1#2\relax}}%
625 \x}
```

\FB@charlistsave holds the all list of characters which have their \XeTeXcharclass value modified in French: it always includes high punctuation, French quotes, opening delimiters and no-break spaces. If ucharclasses is loaded, non-ASCII characters used in French have to be added; as xeCJK changes the class of some characters used in French, these have to be saved too if xeCJK is loaded.

```
def\FB@charlist{"21,"3A,"3B,"3F,"AB,"BB,"28,"5B,"A0,"202F}
def\FB@charlistUCC{}
def\FB@charlistxeCJK{}
def\FB@charlistsave{\FB@charlist}
difLaTeXe
```

```
\AtBeginDocument{%
631
          \@ifpackageloaded{ucharclasses}%
632
             {\ifdefined\BasicLatinClass
633
                \RenewCommandCopy{\FB@stdchar}{\BasicLatinClass}%
634
                \def\FB@charlistUCC{"C0,"C2,"C6,"C7,"C8,"C9,"CA,"CB,"CE,"CF,%
635
                  "D4, "D6, "D9, "DB, "DC, "E0, "E2, "E6, "E7, "E8, "E9, "EA, "EB, "EE, %
636
                  "EF, "F4, "F6, "F9, "FB, "FC, "152, "153, "17F, "2019}%
637
                \addto\FB@charlist{,\FB@charlistUCC}%
638
                \edef\FB@charlistsave{\FB@charlist}%
639
              \fi
640
             }{}%
641
          \@ifpackageloaded{xeCJK}%
642
             {\def\FB@charlistxeCJK{%
643
                       "29, "5D, "7B, "7D, "2C, "2D, "2E, "22, "25, "27, "60, "2019}%
644
              \addto\FB@charlist{,\FB@charlistxeCJK}%
645
              \edef\FB@charlistsave{\FB@charlist}%
             }{}%
647
        }
648
      \fi
649
```

\FB@xetex@punct@french The following command will be executed when entering French, it first saves the values to be modified, then fits them to our needs.

```
\newcommand*{\FB@xetex@punct@french}{%
   \babel@savevariable{\XeTeXinterchartokenstate}%
   \bbl@for\FB@char\FB@charlistsave
   {\FBsavevariable@loop{\XeTeXcharclass}{\FB@char}}%
```

If ucharclasses is loaded, force non-ASCII used in French to class \FB@stdchar (=\BasicLatinClass).

```
654 \ifx\FB@charlistUCC\@empty\else
655 \bbl@for\FB@char\FB@charlistUCC
656 {\XeTeXcharclass \FB@char \FB@stdchar}%
657 \fi
```

These characters have their class changed by xeCJK.sty, let's reset their class in French.

This will avoid spurious spaces in (!), [?] and with Unicode non-breaking spaces (U+00A0, U+202F):

```
\bbl@for\FB@char {\\[,\\(,\\A0,\\\202F}\\)
663 \{\XeTeXcharclass\FB@char=\FB@punctnul}\\
```

Let's now define specific classes for punctuation and interactions between classes. When false, the flag \ifFB@spacing switches off any interaction between classes (this

flag is controlled by user-level command \NoAutoSpacing; this flag is also set to false when the current font is a typewriter font).

```
\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{
```

Small glues such as "glue 1sp" in tabular 'l' columns or "glue 0 plus 1 fil" in tabular 'c' columns or 1stlisting environment should not trigger any extra space; they will still do when AutoSpacePunctuation is true: \XeTeXcharclass=\FB@nonchar isn't specific to glue tokens (this class includes box and math boundaries f.i.), so the \else part cannot be omitted.

```

              \ifFB@spacing\FB@guillspace\fi}%
701
```

End of specific code for punctuation with modern XeTeX engines.

708**\fi** 

## 2.2.3 Punctuation with standard (pdf)TeX

In standard (pdf)TeX we need to make the four characters; !? and: 'active' and provide their definitions. Before doing so, we have to save some definitions involving:.

```
709 \newif\ifFB@koma
710 \ifLaTeXe
    \@ifclassloaded{scrartcl}{\FB@komatrue}{}
712
    \@ifclassloaded{scrbook}{\FB@komatrue}{}
     \@ifclassloaded{scrreprt}{\FB@komatrue}{}
    \ifFB@koma\def\FB@std@capsep{:\ }\fi
714
    \Qifclassloaded{beamer}{\def\FBQstdQcapsep{:\ }}{}
716 \@ifclassloaded{memoir}{\def\FB@std@capsep{: }}{}
717 \fi
718 \ifFB@active@punct
    \initiate@active@char{:}%
    \initiate@active@char{;}%
    \initiate@active@char{!}%
    \initiate@active@char{?}%
```

We first tune the amount of space before;!? and:. This should only happen in horizontal mode, hence the test \ifhmode.

In horizontal mode, if a space has been typed before ';' we remove it and put a non-breaking \FBthinspace instead. If no space has been typed, we add \FDP@thinspace which will be defined, up to the user's wishes, as a non-breaking \FBthinspace or as \@empty.

```
\declare@shorthand{french}{;}{%
723
       \ifFB@spacing
724
         \ifhmode
725
            \ifdim\lastskip>1sp
726
              \unskip\penalty\@M\FBthinspace
727
            \else
728
              \FDP@thinspace
729
           \fi
730
         \fi
731
       \fi
732
```

Now we can insert a; character.

\string;}

733

```
The next three definitions are very similar.

763
         \fi
764
       \fi
765
       \string:}
```

When the active characters appear in an environment where their French behaviour is not wanted they should give an 'expected' result. Therefore we define shorthands at system level as well.

```
767 \declare@shorthand{system}{:}{\string:}
768 \declare@shorthand{system}{!}{\string!}
769 \declare@shorthand{system}{?}{\string?}
770 \declare@shorthand{system}{;}{\string;}
```

We specify that the French group of shorthands should be used when switching to French.

771 \addto\extrasfrench{\languageshorthands{french}%

These characters are 'turned on' once, later their definition may vary. Don't misunderstand the following code: they keep being active all along the document, even when leaving French.

```
772
       \bbl@activate{:}\bbl@activate{;}%
       \bbl@activate{!}\bbl@activate{?}%
773
774
     \addto\noextrasfrench{%
775
       \bbl@deactivate{:}\bbl@deactivate{;}%
776
       \bbl@deactivate{!}\bbl@deactivate{?}%
777
    }
778
779\fi
```

## 2.2.4 Punctuation switches common to all engines

A new 'if' \ifFBAutoSpacePunctuation needs to be defined now to control the two possible ways of dealing with 'high punctuation'. it's default value is true, but it can be set to false by \frenchsetup{AutoSpacePunctuation=false} for finer control.

780 \newif\ifFBAutoSpacePunctuation \FBAutoSpacePunctuationtrue

\AutoSpaceBeforeFDP\autospace@beforeFDP\ and \noautospace@beforeFDP\ are internal commands. \NoAutoSpaceBeforeFDP \autospace@beforeFDP defines commands \FDP@thinspace and \FDP@colonspace as non-breaking spaces and sets LuaTeX attribute \FB@addDPspace to 1 (true), while \noautospace@beforeFDP makes them no-op and sets flag \FB@addDPspace to 0 (false). User commands \AutoSpaceBeforeFDP and \NoAutoSpaceBeforeFDP do the same and take care of the flag \ifFBAutoSpacePunctuation in LaTeX.

Set the default now for Plain (done later for LaTeX).

```
781 \def\autospace@beforeFDP{%
    \ifFB@luatex@punct \FB@addDPspace=\@ne \fi
     \def\FDP@thinspace{\penalty\@M\FBthinspace}%
783
     \def\FDP@colonspace{\penalty\@M\FBcolonspace}}
785 \def\noautospace@beforeFDP{%
    \ifFB@luatex@punct \FB@addDPspace=\z@ \fi
786
    \let\FDP@thinspace\@empty
787
788
    \let\FDP@colonspace\@empty}
789\ifLaTeXe
     \def\AutoSpaceBeforeFDP{\autospace@beforeFDP
790
                              \FBAutoSpacePunctuationtrue}
791
     \def\NoAutoSpaceBeforeFDP{\noautospace@beforeFDP
792
                                \FBAutoSpacePunctuationfalse}
793
    \AtEndOfPackage{\AutoSpaceBeforeFDP}
794
795 \else
     \let\AutoSpaceBeforeFDP\autospace@beforeFDP
    \let\NoAutoSpaceBeforeFDP\noautospace@beforeFDP
797
    \AutoSpaceBeforeFDP
```

\rmfamilyFB In LaTeX2e \ttfamily (and hence \texttt) will be redefined 'AtBeginDocument' as \sffamilyFB \ttfamilyFB so that no space is added before the four; :!? characters, even if \ttfamilyFB AutoSpacePunctuation is true. When AutoSpacePunctuation is false, the eventually typed spaces are left unchanged (not turned into thin spaces, no penalty added). \rmfamily and \sffamily need to be redefined also (\ttfamily is not always used inside a group, its effect can be cancelled by \rmfamily or \sffamily).

These redefinitions can be canceled if necessary, for instance to recompile older documents, see option OriginalTypewriter below.

To be consistent with what is done for the; :!? characters, \ttfamilyFB also switches off insertion of spaces inside French guillemets when they are typed in as characters with the 'og'/'fg' options in \frenchsetup{}. This is also a workaround for the weird behaviour of these characters in verbatim mode.

```
800 \ifLaTeXe
801 \DeclareRobustCommand\ttfamilyFB{\FB@spacing@off \ttfamilyORI}
802 \DeclareRobustCommand\rmfamilyFB{\FB@spacing@on \rmfamilyORI}
803 \DeclareRobustCommand\sffamilyFB{\FB@spacing@on \sffamilyORI}
804 \fi
```

\NoAutoSpacing The following command disables automatic spacing for high punctuation and French quote characters; it also switches off active punctuation characters (if any). It is engine independent (works for TeX, LuaTeX and XeTeX based engines) and is meant to be used inside a group. The faked definition of \texorpdfstring will be overwritten by hyperref.sty.

```
805 \providecommand\texorpdfstring[2]{#1}
806 \DeclareRobustCommand*{\NoAutoSpacing}{%
807 \texorpdfstring{\FB@spacing@off
808 \ifFB@active@punct\shorthandoff{;:!?}\fi}{}%
809 }
```

## 2.3 Commands for French quotation marks

\guillemotleft pdfLaTeX users are supposed to use 8-bit output encodings (T1, LY1,...) to type-\guillemotright set French, those who still stick to OT1 should load aeguill or a similar package. \textquoteddblleft In both cases the commands \guillemotleft and \guillemotright will print the \textquoteddblright French opening and closing quote characters from the output font. For XeLaTeX and LuaLaTeX, \guillemotleft and \guillemotright are defined by package fontspec (v. 2.5d and up).

We provide the following definitions for non-LaTeX users only as fall-back, they are welcome to change them for anything better.

```
810 \ifLaTeXe
```

```
811 \else
     \ifFBunicode
       \def\guillemotleft{{\char"00AB}}
813
814
       \def\guillemotright{{\char"00BB}}
       \def\textquotedblleft{{\char"201C}}
815
       \def\textquotedblright{{\char"201D}}
816
     \else
817
       \def\guillemotleft{\leavevmode\raise0.25ex
818
                           \hbox{$\scriptscriptstyle\11$}}
819
       \def\guillemotright{\raise0.25ex
820
                            \hbox{$\scriptscriptstyle\gg$}}
821
       \def\textquotedblleft{``}
       \def\textquotedblright{''}
823
     \fi
824
825
     \let\xspace\relax
826 \fi
```

\FBgspchar The next step is to provide correct spacing after '«' and before '»'; no line break is \FB@og allowed neither after the opening one, nor before the closing one. French quotes \FB@fg (including spacing) are printed by \FB@og and \FB@fg, the expansion of the top level commands \og and \fg is different in and outside French.

\FB@og and \FB@fg are now designed to work in bookmarks.

```
827 \newcommand*{\FB@og}{\texorpdfstring{\@FB@og}{\guillemotleft\space}}
828 \newcommand*{\FB@fg}{\texorpdfstring{\@FB@fg}{\space\guillemotright}}
```

The internal definitions \@FB@og and \@FB@fg need some engine-dependent tuning: for LuaTeX, \FB@spacing is set to 0 locally to prevent the quotes characters from adding space when option og=«, fg=» is set.

```
829 \newcommand*{\FBQguillspace}{\penalty\QM\FBguillspace}
830 \newcommand*{\FBgspchar}{\char"A0\relax}
831 \newif\ifFBucsNBSP
832 \ifFB@luatex@punct
     \DeclareRobustCommand*{\QFBQog}{\leavevmode
833
              \bgroup\FB@spacing=\z@ \guillemotleft\egroup
834
              \ifFBucsNBSP\FBgspchar\else\FB@guillspace\fi}
835
     \DeclareRobustCommand*{\@FB@fg}{\ifdim\lastskip>\z@\unskip\fi
836
837
              \ifFBucsNBSP\FBgspchar\else\FB@guillspace\fi
              \bgroup\FB@spacing=\z@ \guillemotright\egroup}
838
839\fi
With XeTeX, \ifFB@spacing is set to false locally for the same reason.
840 \ifFB@xetex@punct
     \DeclareRobustCommand*{\QFBQoq}{\leavevmode
841
            \bgroup\FB@spacingfalse\guillemotleft\egroup
842
            \FB@guillspace}
843
     \DeclareRobustCommand*{\@FB@fg}{\ifdim\lastskip>\z@\unskip\fi
```

```
\FB@guillspace
845
           \bgroup\FB@spacingfalse\guillemotright\egroup}
846
847 \fi
848 \ifFB@active@punct
     \DeclareRobustCommand*{\QFBQog}{\leavevmode
849
           \guillemotleft
850
           \FB@guillspace}
851
     \DeclareRobustCommand*{\QFBQfg}{\ifdim\lastskip>\zQ\unskip\fi
852
           \FB@quillspace
853
           \guillemotright}
854
855 \fi
```

\og The user level macros for quotation marks are named \og ("ouvrez guillemets") and \fg \fg ("fermez guillemets"). Another option for typesetting quotes in French is to use the command \frquote (see below). Dummy definition of \og and \fg just to ensure that this commands are not yet defined.

```
856 \newcommand*{\og}{\@empty}
857 \newcommand*{\fg}{\@empty}
```

The definitions of \og and \fg for quotation marks are switched on and off through the \extrasfrench \noextrasfrench mechanism. Outside French, \og and \fg will typeset standard English opening and closing double quotes. We'll try to be smart to users of David Carlisle's xspace package: if this package is loaded there will be no need for \{\} or \ to get a space after \fg, otherwise \xspace will be defined as \relax (done at the end of this file).

```
858 \ifLaTeXe
     \def\bbl@frenchguillemets{%
859
           \renewcommand*{\og}{\FB@og}%
860
           \renewcommand*{\fg}{\FB@fg\xspace}}
861
     \renewcommand*{\og}{\textquotedblleft}
862
     \renewcommand*{\fg}{\ifdim\lastskip>\z@\unskip\fi
863
                          \textquotedblright\xspace}
864
865 \else
     \def\bbl@frenchguillemets{\let\og\FB@og
866
                                \let\fg\FB@fg}
867
     \def\og{\textquotedblleft}
868
     \def\fg{\ifdim\lastskip>\z@\unskip\fi\textquotedblright}
869
870 \fi
871 \addto\extrasfrench{\babel@save\og \babel@save\fg
                        \bbl@frenchguillemets}
```

\frquote Another way of entering French quotes relies on \frquote{} with supports up to two levels of quotes. Let's define the default quote characters to be used for level one or two of quotes...

```
873 \newcommand*{\ogi}{\FB@og}
```

```
874 \newcommand*{\fgi}{\FB@fg}
875 \newcommand*{\Qogi}{\ifmmode\hbox{\ogi}\else\ogi\fi}
876 \newcommand*{\@fgi}{\ifmmode\hbox{\fgi}\else\fgi\fi}
877 \newcommand*{\ogii}{\textquotedblleft}
878 \newcommand*{\fgii}{\textquotedblright}
879 \newcommand*{\Qogii}{\ifmmode\hbox{\ogii}\else\ogii\fi}
880 \newcommand*{\@fgii}{\ifmmode\hbox{\fgii}\else\fgii\fi}
and the needed technical stuff to handle options:
881 \newcount\FBguill@level
882 \newtoks\FBold@everypar
\FB@addquote@everypar was borrowed from csquotes.sty.
883 \def\FB@addquote@everypar{%
     \let\FBnew@everypar\everypar
     \FBold@everypar=\expandafter{\the\everypar}%
885
     \FBnew@everypar={\the\FBold@everypar\FBeverypar@quote}%
886
     \let\everypar\FBold@everypar
887
     \let\FB@addquote@everypar\relax
888
889 }
890 \newif\ifFBcloseguill \FBcloseguilltrue
891 \newif\ifFBInnerGuillSingle
892 \def\FBguillopen{\bgroup\NoAutoSpacing\guillemotleft\egroup}
893 \def\FBguillclose{\bgroup\NoAutoSpacing\guillemotright\egroup}
894 \let\FBguillnone\empty
895 \let\FBeveryparguill\FBguillopen
896 \let\FBeverylineguill\FBguillnone
897 \let\FBeverypar@quote\relax
898 \let\FBeveryline@quote\empty
```

The main command \frquote accepts (in LaTeX2e only) a starred version which suppresses the closing quote; it is meant to be used for inner quotations which end together with the outer one, then only one closing guillemet (the outer one) should be printed. \frquote (without star) is now designed to work in bookmarks too.

```
899 \ifLaTeXe
     \DeclareRobustCommand\frquote{%
900
       \texorpdfstring{\@ifstar{\FBcloseguillfalse\fr@quote}%
901
                                {\FBcloseguilltrue \fr@quote}}%
902
                      {\bm@fr@quote}%
903
    }
904
     \newcommand{\bm@fr@quote}[1]{%
905
       \guillemotleft\space #1\space\guillemotright}
906
907 \else
908 \newcommand\frquote[1]{\fr@quote{#1}}
909\fi
```

The internal command \fr@quote takes one (long) argument: the quotation text.
910 \newcommand{\fr@quote}[1]{%

```
911 \leavevmode

912 \advance\FBguill@level by \@ne

913 \ifcase\FBguill@level

914 \or
```

This for level 1 (outer) quotations: set \FBeverypar@quote for level 1 quotations and add it to \everypar using \FB@addquote@everypar, then print the quotation:

```
915 \ifx\FBeveryparguill\FBguillnone
916 \else
917 \def\FBeverypar@quote{\FBeveryparguill\FB@guillspace}%
918 \FB@addquote@everypar
919 \fi
920 \@ogi #1\@fgi
921 \or
```

This for level 2 (inner) quotations: Omega's command \localleftbox included in LuaTeX, is convenient for repeating guillemets at the beginning of every line.

```
\ifx\FBeverylineguill\FBguillopen
922
923
         \def\FBeveryline@quote{\FB@addGUILspace=\z@
                                 \guillemotleft\FBguillspace}%
924
         \localleftbox{\FBeveryline@guote}%
925
         \let\FBeverypar@quote\relax
926
         \@ogi #1\ifFBcloseguill\@fgi\fi
927
       \else
928
         \ifx\FBeverylinequill\FBquillclose
929
           \def\FBeveryline@quote{\FB@addGUILspace=\z@
930
931
                                   \quillemotright\FBguillspace}%
           \localleftbox{\FBeveryline@quote}%
932
933
           \let\FBeverypar@quote\relax
           \@ogi #1\ifFBcloseguill\@fgi\fi
934
         \else
935
```

otherwise we need to redefine \FBeverypar@quote (and eventually \ogii, \fgii) for level 2 quotations:

```
\let\FBeverypar@quote\relax
936
           \ifFBInnerGuillSingle
937
             \def\ogii{\leavevmode
938
939
                        \guilsinglleft\FB@guillspace}%
             \def\fgii{\ifdim\lastskip>\z@\unskip\fi
940
                        \FB@guillspace\guilsinglright}%
941
             \ifx\FBeveryparguill\FBguillopen
942
               \def\FBeverypar@quote{\guilsinglleft\FB@guillspace}%
943
             \fi
944
             \ifx\FBeveryparguill\FBguillclose
945
               \def\FBeverypar@quote{\guilsinglright\FB@guillspace}%
946
             \fi
           \fi
948
           \@ogii #1\ifFBcloseguill \@fgii \fi
949
```

```
\fi
950
        \fi
951
      \else
952
Warn if \FBguill@level > 2:
        \ifx\PackageWarning\@undefined
953
          \fb@warning{\noexpand\frquote\space handles up to
954
955
                       two levels. \\ Quotation not printed. \}%
        \else
956
          \PackageWarning{french.ldf}{%
957
             \protect\frquote\space handles up to two levels.
958
             \MessageBreak Quotation not printed. Reported}
959
        \fi
960
961
     \fi
```

Closing: step down \FBguill@level and clean on exit. Changes made global in case \frquote{} ends inside an environment.

```
962 \global\advance\FBguill@level by \m@ne
963 \ifcase\FBguill@level \global\let\FBeverypar@quote\relax
964 \or \gdef\FBeverypar@quote\FBeveryparguill\FB@guillspace}%
965 \global\let\FBeveryline@quote\empty
966 \ifx\FBeverylineguill\FBguillnone\else\localleftbox{}\fi
967 \fi
968 }
```

The next command is intended to be used in list environments to suppress quotes which might be added by \FBeverypar@quote after items for instance.

969 \newcommand\*{\NoEveryParQuote}{\let\FBeveryparguill\FBguillnone}

### 2.4 Date in French

\frenchtoday The following code creates a macro \datefrench which in turn defines command \frenchdate \frenchtoday (\today is defined as \frenchtoday in French). The corresponding \datefrench commands for the French dialect, \dateacadian and \acadiantoday are also created btw. This new implementation relies on commands \SetString and \SetStringLoop, therefore requires Babel 3.10 or newer.

Explicitly defining \BabelLanguages as the list of all French dialects defines both \datefrench and \dateacadian; this is required as french.ldf is read only once even if both language options french and acadian are supplied to Babel. Coding \StartBabelCommands\*{french,acadian} would only define \date\CurrentOption, leaving the second language undefined in Babel's sens.

```
970 \def\BabelLanguages{french,acadian}
971 \StartBabelCommands*{\BabelLanguages}{date}
972         [unicode, fontenc=TU EU1 EU2, charset=utf8]
973         \SetString\monthiiname{février}
974         \SetString\monthviiiname{août}
```

```
975 \SetString\monthxiiname{décembre}

976 \StartBabelCommands*{\BabelLanguages}{date}

977 \SetStringLoop{month#1name}{%

978 janvier,f\'evrier,mars,avril,mai,juin,juillet,%

979 ao\^ut,septembre,octobre,novembre,d\'ecembre}

980 \SetString\today{\FB@date{\year}{\month}{\day}}

981 \EndBabelCommands
```

\frenchdate (which produces an unbreakable string) and \frenchtoday (breakable) both rely on \FB@date, the inner group is needed for \hbox.

#### 2.5 Extra utilities

Let's provide the French user with some extra utilities.

\up \up eases the typesetting of superscripts like '1er'. Up to version 2.0 of babel-\up french \up was just a shortcut for \textsuperscript in LaTeX2e, but several users complained that \textsuperscript typesets superscripts too high and too big, so we now define \up fup as an attempt to produce better looking superscripts. \up is defined as \up but \up frenchsetup{FrenchSuperscripts=false} redefines \up as \textsuperscript for compatibility with previous versions.

When a font has built-in superscripts, the best thing to do is to just use them, otherwise \fup has to simulate superscripts by scaling and raising ordinary letters. Scaling is done using package scalefnt which will be loaded at the end of Babel's loading (babel-french being an option of Babel, it cannot load a package while being read).

```
990 \newif\ifFB@poorman
991 \newdimen\FB@Mht
992 \ifLaTeXe
993 \AtEndOfPackage{\RequirePackage{scalefnt}}
```

\FB@up@fake holds the definition of fake superscripts. The scaling ratio is 0.65, raising is computed to put the top of lower case letters (like 'm') just under the top of upper case letters (like 'M'), precisely 12% down. The chosen settings look correct for most fonts, but can be tuned by the end-user if necessary by changing \FBsupR and \FBsupS commands.

\FB@1c is defined as \MakeLowercase to inhibit the uppercasing of superscripts (this may happen in page headers with the standard classes but is wrong); \FB@1c can be redefined to do nothing by option LowercaseSuperscripts=false of \frenchsetup{}.

```
\mbox{newcommand}^{{\ }}{-0.12}
994
      \newcommand*{\FBsupS}{0.65}
995
      \newcommand*{\FB@lc}[1]{\MakeLowercase{#1}}
996
997
      \DeclareRobustCommand*{\FB@up@fake}[1]{%
        \settoheight{\FB@Mht}{M}%
998
        \addtolength{\FB@Mht}{\FBsupR \FB@Mht}%
999
        \addtolength{\FB@Mht}{-\FBsupS ex}%

```

The only packages I currently know to take advantage of real superscripts are a) realscripts used in conjunction with XeLaTeX or LuaLaTeX and OpenType fonts having the font feature 'VerticalPosition=Superior' and b) fourier (from version 1.6) when Expert Utopia fonts are available.

\FB@up checks whether the current font is a Type1 'Expert' (or 'Pro') font with real superscripts or not (the code works currently only with fourier-1.6 but could work with any Expert Type1 font with built-in superscripts, see below), and decides to use real or fake superscripts. It works as follows: the content of \f@family (family name of the current font) is split by \FB@split into two pieces, the first three characters ('fut' for Fourier, 'ppl' for Adobe's Palatino, ...) stored in \FB@firstthree and the rest stored in \FB@suffix which is expected to be 'x' or 'j' for expert fonts.

```
1003 \def\FB@split#1#2#3#4\@nil{\def\FB@firstthree{#1#2#3}%
1004 \def\FB@suffix{#4}}
1005 \def\FB@x{x}
1006 \def\FB@j{j}
1007 \DeclareRobustCommand*{\FB@up}[1]{%
1008 \bgroup \FB@poormantrue
1009 \expandafter\FB@split\f@family\@nil
```

Then \FB@up looks for a .fd file named t1fut-sup.fd (Fourier) or t1ppl-sup.fd (Palatino), etc. supposed to define the subfamily (fut-sup or ppl-sup, etc.) giving access to the built-in superscripts. If the .fd file is not found by \IfFileExists, \FB@up falls back on fake superscripts, otherwise \FB@suffix is checked to decide whether to use fake or real superscripts.

```
1010
          \edef\reserved@a{\lowercase{%
             \noexpand\IfFileExists{\f@encoding\FB@firstthree -sup.fd}}}%

```

\bname These commands are meant to easily enter family names (in small capitals for the \bsc latter) while avoidind hyphenation. A \kern0pt is used instead of \mbox because \mbox would break microtype's font expansion; as a positive side effect, composed names (such as Dupont-Durand) can now be hyphenated on explicit hyphens.

```
1063 \ifLaTeXe

## 2.6 Formatting numbers

\StandardMathComma As mentioned in the TFXbook p. 134, the comma is of type \mathpunct in math mode:

\DecimalMathComma it is automatically followed by a thin space. This is convenient in lists and intervals but unpleasant when the comma is used as a decimal separator in French: it has to be entered as {,}. \DecimalMathComma makes the comma be an ordinary character (of type \mathord) in French (or Acadian) only (no space added); \StandardMathComma switches back to the standard behaviour of the comma.

Unfortunately, \newcount inside \if breaks Plain formats.

```

The comma is reset to type \mathpunct when leaving French dialects (only if the icomma package is not loaded).

nombre We redefine \nombre for LaTeX2e. The command \nombre is now borrowed from numprint.sty for LaTeX2e. There is no point to maintain the former tricky code when a package is dedicated to do the same job and more. A warning is issued at the first call of \nombre if \numprint is not defined, suggesting what to do. The package numprint is not loaded automatically by babel-french because of possible options conflict.

```
1206\renewcommand*{\nombre}[1]{\Warning@nombre{#1}}
1207 \newcommand*{\Warning@nombre}[1]{%

#### Figure and table captions 2.8

\FBWarning \FBWarning is an alias of \PackageWarning{french.ldf} which can be made silent by option SuppressWarning.

```
1295 \newcommand{\FBWarning}[1]{\PackageWarning{french.ldf}{#1}}
```

\CaptionSeparator Let's consider now captions in figures and tables. In French, captions in figures and tables should never be printed as 'Figure 1: ' which is the default in standard LaTeX2e classes (a space should preceed the colon in French). This flaw may occur with pdfLaTeX as ':' is made active too late. With LuaLaTeX and XeLaTeX, this glitch doesn't occur, you get 'Figure 1:' which is correct in French. With pdfLaTeX babel-french provides the following workaround.

> The standard definition of \@makecaption (e.g., the one provided in article.cls, report.cls, book.cls which is frozen for LaTeX2e according to Frank Mittelbach), is saved in \STD@makecaption. 'AtBeginDocument' we compare it to its current definition (some classes like memoir, koma-script classes, AMS classes, ua-thesis.cls... change it). If they are identical, babel-french just adds a hook called \FBCaption@Separator to \@makecaption; \FBCaption@Separator defaults to ': ' as in the standard definition of \@makecaption and will be changed to ':' in French 'AtBeginDocument'; it can be also set to \CaptionSeparator ('-') using CustomiseFigTabCaptions.

> While saving the standard definition of \@makecaption we have to make sure that characters ':' and '>' have \catcode 12 (babel-french makes ':' active and spanish.ldf makes '>' active).

```
1296 \bgroup
      \catcode`: =12 \catcode`> =12 \relax
1297
      \long\gdef\STD@makecaption#1#2{%
1298
        \vskip\abovecaptionskip
1299
1300
        \sbox\@tempboxa{#1: #2}%
        \ifdim \wd\@tempboxa >\hsize
1301
          #1: #2\par
1302
        \else
1303
          \global \@minipagefalse
1304
          \hb@xt@\hsize{\hfil\box\@tempboxa\hfil}%
1305
1306
        \vskip\belowcaptionskip}
1307
1308 \egroup
```

No warning is issued for SMF and AMS classes as their layout of captions is compatible with French typographic standards.

With memoir and koma-script classes, babel-french customises \captiondelim or \captionformat in French (unless option CustomiseFigTabCaptions is set to false) and issues no warning.

When \@makecaption has been changed by another class or package, a warning is printed in the .log file.

Enable the standard warning only if high punctuation is active.

#### 2.9 Dots...

\FBtextellipsis Unless a ready-made character is available in the current font, LaTeX's default definition of \textellipsis includes a \kern at the end; this space is not wanted in some cases (before a closing brace for instance) and \kern breaks hyphenation of the next word. We define \FBtextellipsis for French (in LaTeX only) the same way but without the last \kern.

LY1 has a ready made character for \textellipsis, it should be used in French. The same is true for Unicode fonts in use with XeTeX and LuaTeX.

```

# 2.11 Setup options: key/value stuff (l3keys)

Check LaTeX2e version (support for 13keys required).

1409 \NeedsTeXFormat{LaTeX2e}[2022-06-01]

All setup options are handled by command \frenchsetup{} based on the 13keys' \SetKeys{} command. A list of flags is defined beforehand and set to default values which will possibly be changed 'AtEndOfPackage' in case French is the main language. After this, \frenchsetup{} eventually modifies the preset values of these flags.

Some options processing occurs in \frenchsetup{}, only for options explicitly set by \frenchsetup{}, the rest 'AtBeginDocument'; any option affecting \extrasfrench{} must be immediatelt processed by \frenchsetup{}: when French is the main language, \extrasfrench{} is executed by Babel when it switches the main language and this occurs before reading the stuff postponed by babel-french 'AtBeginDocument'. Reexecuting \extrasfrench{} is not an option because of its side-effects (f.i. \babel@savevariable did not work for French).

We first define a collection of conditionals and set their defaults (true or false).

```

```

The defaults values of these flags are choosen so that babel-french does not change anything regarding the global layout. Some of them must be toogled when French (or a French dialect) is the main language. The latter (last option of Babel, stored in \bbl@main@language) will be known 'AtEndOfPackage'. So we postpone the \bbl@main@language checking until then.

Our list customisation conflicts with the beamer class and with the beamerarticle package. The patch provided in beamerbasecompatibility solves the conflict except in case of language changes, so we provide our own patch. When the beamer is loaded, lists are not customised at all to ensure compatibility. The beamerarticle package needs to be loaded *before* Babel, a warning is issued otherwise, see section 2.10; a light customisation is compatible with the beamerarticle package.

1684 \}
```

Inputing French quotes as *single characters* when they are available on the keyboard (through a compose key for instance) is more comfortable than typing \og and \fg. Life is simple here with modern LuaTeX or XeTeX engines: we just have to activate the \FB@addGUILspace attribute for LuaTeX or set \XeTeXcharclass of quotes to the proper value for XeTeX.

With pdfTeX (or old LuaTeX and XeTeX engines), quote characters are made active and expand to \og\ignorespaces and {\fg} respectively if the current language is French, and to \guillemotleft and \guillemotright otherwise (think of German quotes), this is done by \FB@@og and \FB@@fg; thus correct non-breaking spaces will be added automatically to French quotes. The quote characters typed in depend on the input encoding, it can be single-byte (latin1, latin9, applemac,...) or multi-bytes (utf-8, utf8x); the next command is meant for checking whether a character is single-byte (\FB@second is empty) or not.

```
1685 \def\FB@parse#1#2\endparse{\def\FB@second{#2}}%
1686 \newcommand*{\FB@@og}%
1687
      {\ifFBfrench
         \ifFB@spacing \FB@og\ignorespaces
1688
         \else \guillemotleft
1689
         \fi
1690
       \else \guillemotleft
1691
1692
       \fi
      }
1693
1694 \newcommand* {\FB@@fg}%
      {\ifFBfrench
1695
         \ifFB@spacing \FB@fg
1696
         \else \guillemotright
1697
         \fi
1698
       \else \guillemotright
1699
1700
1701
1702 \newcommand*{\FBog@setup}[1]%
      {\ifFBunicode
```

LuaTeX or XeTeX in use, first try modern LuaTeX: we just need to set LuaTeX's attribute \FB@addGUILspace to 1,

```
1704 \iffB@luatex@punct
1705 \FB@addGUILspace=1 \relax
1706 \fi
```

```
then with XeTeX it is a bit more tricky:
```

```
1707 \ifFB@xetex@punct
```

\XeTeXinterchartokenstate is defined, we just need to set \XeTeXcharclass to \FB@guilo for the French opening quote in T1 and Unicode encoding (see subsection 2.2).

Issue a warning with older Unicode engines requiring active characters.

```
1713 \iffB@active@punct
1714 \FBWarning{Option og=« not supported with this version of
1715 \MessageBreak LuaTeX/XeTeX; reported}% »
1716 \fi
1717 \else
```

This is for conventional TeX engines:

```
1718 \AtBeginDocument{%
1719 \ifdefined\uc@dclc
```

Package inputenc with utf8x (ucs) encoding loaded, use \uc@dclc:

```
1720 \uc@dclc{171}{default}{\FB@@og}%
1721 \else
```

if encoding is not utf8x, check if the argument of og is a single-byte character:

```
1722 \FB@parse#1\endparse
1723 \ifx\FB@second\@empty
```

This means 8-bit character encoding. Package MULEenc (from CJK) defines \mule@def to map characters to control sequences.

Package inputenc not loaded, no way...

```
1731 \FBWarning{Option `og' requires package
1732 inputenc;\MessageBreak reported}%
1733 \fi
1734 \fi
1735 \else
```

This means multi-byte character encoding, we assume UTF-8

\DeclareUnicodeCharacter{00AB}{\FB@00g}%

### 2.12 French lists

\listFB Vertical spacing in lists should be shorter in French texts than the defaults provided \listORI by LaTeX. Note that the easy way, just changing values of vertical spacing parameters \FB@listVsettings when entering French and restoring them to their defaults on exit would not work; so we define the command \FB@listVsettings to hold the settings to be used by the French variant \listFB of \list. Note that switching to \listFB reduces vertical spacing in all environments built on \list: itemize, enumerate, description, but also abstract, quotation, quote and verse...

The amount of vertical space before and after a list is given by \topsep + \parskip (+ \partopsep if the list starts a new paragraph). IMHO, \parskip should be added only when the list starts a new paragraph, so I subtract \parskip from \topsep and add it back to \partopsep; this will normally make no difference because \parskip's default value is 0pt, but will be noticeable when \parskip is not null.

```
1990 \let\listORI\list
1991 \let\endlistORI\endlist
1992 \newdimen\FB@parskip
1993 \def\FB@listVsettings{%
1994 \setlength{\topsep}{0.8ex plus 0.4ex minus 0.4ex}%
1995 \setlength{\partopsep}{0.4ex plus 0.2ex minus 0.2ex}%
```

\parskip is of type 'skip', its mean value only (not the glue) should be subtracted from \topsep and added to \partopsep, so convert \parskip to a 'dimen' using

#### \FB@parskip.

```
\fB@parskip=\parskip
\addtolength{\topsep}{-\FB@parskip}%
\addtolength{\partopsep}{\FB@parskip}%
\setlength{\itemsep}{0.4ex plus 0.2ex minus 0.2ex}%
\setlength{\parsep}{0.4ex plus 0.2ex minus 0.2ex}%
```

(v3.5q) If \parskip is not null, \parsep is set to \parskip, so paragraphs inside items will be preceded by the same vertical space as paragraphs located outside lists; the vertical skip before items (\itemsep + \parsep) doesn't need to be enlarged.

```
2001 \ifdim\FB@parskip>Opt
2002 \setlength{\parsep}{\FB@parskip}%
2003 \addtolength{\itemsep}{-\FB@parskip}%
2004 \fi
2005 }
2006 \def\listFB#1#2{\listORI{#1}{\FB@listVsettings #2}}
2007 \let\endlistFB\endlistORI
```

Let's now consider French itemize-lists. They differ from those provided by the standard LaTeX classes:

- The '•' is never used in French itemize-lists, an emdash '—' or an endash '—' is preferred for all levels. The item label to be used in French, stored in \FrenchLabelItem\}, defaults to '—' and can be changed using \frenchsetup\} (see section 2.11).
- Vertical spacing between items, before and after the list, should be null with no glue added;
- In French the labels of itemize-lists are vertically aligned as shown p. 6.

\FrenchLabelItem Default labels for French itemize-lists —same label for all levels—, (already defined as \Frlabelitemi empty by \DeclareKey{}):

```
\Frlabelitemii 2008\renewcommand*{\FrenchLabelItem}{\textemdash}
\Frlabelitemiii 2009\renewcommand*{\Frlabelitemi}{\FrenchLabelItem}
\Frlabelitemiv 2010\renewcommand*{\Frlabelitemii}{\FrenchLabelItem}
2011\renewcommand*{\Frlabelitemiii}{\FrenchLabelItem}
2012\renewcommand*{\Frlabelitemiv}}{\FrenchLabelItem}
```

\listindentFB Let's define four dimens \listindentFB, \descindentFB, \labelindentFB and \descindentFB \labelwidthFB to customise lists' horizontal indentations. They are given silly nega-\labelindentFB tive values here in order to eventually enable their customisation in the preamble. \labelwidthFB They will get reasonnable defaults later when entering French (see \setlabelitemsFB and \setlistindentFB) unless they have been customised.

```
2013 \newdimen\listindentFB
2014 \setlength{\listindentFB}{-1pt}
2015 \newdimen\descindentFB
```

```
2016\setlength{\descindentFB}{-1pt}
2017\newdimen\labelindentFB
2018\setlength{\labelindentFB}{-1pt}
2019\newdimen\labelwidthFB
2020\setlength{\labelwidthFB}{-1pt}
```

\leftmarginFB \FB@listHsettings holds the new horizontal settings chosen for French lists itemize, \FB@listHsettings enumerate and description (two possible layouts).

```
2021 \newdimen\leftmarginFB
2022 \def\FB@listHsettings{%
2023 \iffBListItemsAsPar
```

Optional layout: lists' items are typeset as paragraphs with indented labels.

```
2024
        \itemindent=\labelindentFB
        \advance\itemindent by \labelwidthFB
2025
        \advance\itemindent by \labelsep
2026
2027
        \leftmargini\z@
        \bb1@for\FB@dp {2, 3, 4, 5, 6}%
2028
          {\csname leftmargin\romannumeral\FB@dp\endcsname =
2029
             \labelindentFB}%
2030
2031
      \else
```

Default layout: labels hanging into the list left margin.

```
2032 \leftmarginFB=\labelwidthFB
2033 \advance\leftmarginFB by \labelsep
2034 \bbl@for\FB@dp {1, 2, 3, 4, 5, 6}%
2035 {\csname leftmargin\romannumeral\FB@dp\endcsname =
2036 \leftmarginFB}%
2037 \advance\leftmargini by \listindentFB
```

(v3.5q) Same 'parindent' for paragraphs in lists' items (was null as in standard lists).

```
2038 \listparindent=\parindent
2039 \fi
2040 \leftmargin=\csname leftmargin%
2041 \ifnum\@listdepth=\@ne i\else ii\fi\endcsname
2042}
```

\itemizeFB New environment for French itemize-lists.

\FB@itemizesettings \FB@itemizesettings does two things: first suppress all vertical spaces including glue unless option StandardListSpacing is set, then set horizontal indentations according to \FB@listHsettings unless option ListOldLayout is true (compatibility with lists up to v2.5k).

```
2043 \def\FB@itemizesettings{%
2044 \iffBStandardListSpacing
2045 \else

2121 \let\endenumerateFB\endlistORI
```

\descriptionFB Same tuning for the description environment (see classes.dtx for the original definition). Customisable dimen \descindentFB, which defaults to \listindentFB, is added to \itemindent (first level only). When \descindentFB=0pt (1rst level labels start at the left margin), \leftmargini is reduced to \listindentFB instead of \listindentFB + \leftmarginFB.

When option ListItemsAsPar is turned to true, the description items are also displayed as paragraphs; \descindentFB=0pt can be used to push labels to the left margin.

2154 }
```

If GlobalLayoutFrench=true, nothing has to be done at language's switches regarding lists. Otherwise, \extrasfrench saves the standard settings for lists and then executes \update@frenchlists. In both cases, there is nothing to do for lists in \noextrasfrench.

In order to ensure compatibility with packages customising lists, the command \update@frenchlists should not be included in the first call to \extrasfrench which occurs before the relevant flags are finally set, so we define \FB@ufl as \relax, it will be redefined later 'AtBeginDocument' by \FBprocess@options as \update@frenchlists, see p. 70.

Lists' layout changes at language switches only if GlobalLayoutFrench=false.

```
2155 \def\FB@ufl{\relax}
2156 \def\bbl@frenchlistlayout{%

2166 \addto\extrasfrench{\bbl@frenchlistlayout}
```

### 2.13 French indentation of sections

\bbl@frenchindent In French the first paragraph of each section should be indented, this is another difference with US-English. This is controlled by the flag \if@afterindent.

Indentation changes at language switches in only two cases:

a) GlobalLayoutFrench=false,

b) IndentFirst=true and French isn't the main language.

```
2167 \def\bbl@frenchindent{%
2168 \ifFBGlobalLayoutFrench\else\babel@save\@afterindentfalse\fi
2169 \ifFBIndentFirst
2170 \ifFB@mainlanguage@FR\else\babel@save\@afterindentfalse\fi
2171 \let\@afterindentfalse\@afterindenttrue
2172 \@afterindenttrue
2173 \fi}
2174 \addto\extrasfrench{\bbl@frenchindent}
```

## 2.14 Formatting footnotes

The layout of footnotes is controlled by two flags \ifFBAutoSpaceFootnotes and \ifFBFrenchFootnotes which are set by options of \frenchsetup{} (see section 2.11). The layout of footnotes does not depend on the current language (just think of two footnotes on the same page looking different because one was called in a French part, the other one in English!).

\@makefntextFB We then define \@makefntextFB, a variant of \@makefntext which is responsible for the layout of footnotes, to match the specifications of the French 'Imprimerie Nationale': footnotes will be indented by \parindentFFN, numbers (if any) typeset on the baseline (instead of superscripts), right aligned on \parindentFFN and followed by a dot and an half quad kern. Whenever symbols are used to number footnotes (as in \thanks for instance), we switch back to the standard layout (the French layout of footnotes is meant for footnotes numbered by arabic or roman digits).

The value of \parindentFFN will be redefined at the \begin{document}, as the maximum of \parindent and 1.5em unless it has been set in the preamble (the weird value 10in is just for testing whether \parindentFFN has been set or not).

```
2175 \newdimen\parindentFFN 2176 \parindentFFN=10in
```

\FBfnindent will be set 'AtBeginDocument' to the width of the box holding the footnote mark, \dotFFN and \kernFFN (flushed right). It is used by memoir and koma-script classes.

```
2177 \newcommand*{\dotFFN}{.}
2178 \newcommand*{\kernFFN}{\kern .5em}
2179 \newdimen\FBfnindent
```

\@makefntextFB's definition depends on the document's class.

Koma-script classes: they provide \deffootnote, a handy command to customise the footnotes' layout (see English manual scrguien.pdf); it redefines \@makefntext and \@makefnmark. First, save the original definitions.

```
2180 \ifFB@koma
2181 \let\@makefntextORI\@makefntext
2182 \let\@@makefnmarkORI\@@makefnmark
```

\QmakefntextFB and \QQmakefnmarkFB are used when option FrenchFootnotes is true.

\@makefntextTH and \@@makefnmarkTH are meant for the \thanks command used by \maketitle when FrenchFootnotes is true.

```
\deffootnote[\parindentFFN]{Opt}{\parindentFFN}%
2187
2188
                  {\textsuperscript{\thefootnotemark}}

          \llap{\@thefnmark}\dotFFN\kernFFN}%
2210
      }{}
2211
```

Now the default definition of \@makefntextFB for standard LaTeX and AMS classes. The next command prints the footnote mark according to the specifications of the French 'Imprimerie Nationale'. Keep in mind that \@thefnmark might be empty (i.e. in AMS classes' titles)!

```
2212 \providecommand*{\insertfootnotemarkFB}{%
2213  \parindent=\parindentFFN
2214  \rule\z@\footnotesep
2215  \setbox\@tempboxa\hbox{\@thefnmark}%
2216  \ifdim\wd\@tempboxa>\z@
2217  \llap{\@thefnmark}\dotFFN\kernFFN
2218  \fi}
2219 \providecommand\@makefntextFB[1]{\insertfootnotemarkFB #1}
```

The rest of \@makefntext's customisation will be done at the \begin{document}: saving the original definition of \@makefntext, then redefining \@makefntext according to the value of flag \ifFBFrenchFootnotes (true or false).

\\@footnotemark We will save the original definition of \\@footnotemark at the \begin{document} in order to include any customisation that packages might have done; we define a variant \\@footnotemarkFB which just adds a (customisable) thin space before the number or symbol calling a footnote (any space typed in is removed first). The choice between the two definitions (valid for the whole document) is controlled by flag \ifFBAutoSpaceFootnotes.

\@footnotemark's customisation: let's define a customisable thin space which will be added before footnote's call by \@footnotemarkFB.

```
2220 \newcommand*{\FBfnmarkspace}{\kern .5\fontdimen2\font}
2221 \def\@footnotemarkFB{\leavevmode\unskip\unkern
2222 \protect\FBfnmarkspace\@footnotemarkORI}%
```

Switching between French or Standard layout for footnotes is done 'AtBeginDocument'. The LuaTeX command \localleftbox and \FBeverypar@quote used by \frquote{} have to be reset inside footnotes; done for LaTeX based formats only.

```
2223\providecommand\localleftbox[1]{}
2224\AtBeginDocument{%
```

When the footnotebackref package is loaded, babel-french will not customise \@footnotetext in order to keep back referencing working.

# **3 Change History**

Changes listed in reverse order (latest first) and not older than v3.3 (2018).

v3.6c	v3.5o
\frenchsetup: Removed spurious @	General: \shorthandon and
in \FBCompactItemize@setup and	\shorthandoff are no longer
\FBListOldLayout@setup	redefined in LuaTeX (it broke
commands' names 62	\shorthandoff*) 32
v3.6b	\FB@xetex@punct@french:
\NoAutoSpacing: \NoAutoSpacing	\shorthandon and \shorthandoff
must be inhibited in bookmarks 39	are no longer redefined (it broke
v3.6a	\shorthandoff*) 34
General: Internal 'l3keys' replaces	frenchb.lua: Opening guill.: look
package 'keyval' for options'	ahead when next is a penalty
management 59	(nobreak space) 29
\@footnotemark: Allow customisation	v3.5n
of the space added in	General: \FBGlobalLayoutFrench no
\footnotemarkFB 82	longer set to false when French is
\degres: Simplify \degres definition	not the main language 60
for text and math mode:	\bbl@frenchindent:
\textdegree always defined (TS1)	\bbl@frenchindent changed.
since 2019 49	\bbl@nonfrenchindentremoved. 80
v3.5s	\bsc: Added command \bname (no
General: Footnotes: no customising of	small caps) 48
\@footnotetext when the	v3.5m
footnotebackref package is loaded.	\FBtextellipsis: No longer redefine
Just warn the user 83	\dots, only \textellipsis's
frenchb.lua: A ':' followed by '-' or a	default definition is changed in
ligature should not trigger spacing. 27	French 57
v3.5r	v3.5l
General: Compatibility with	General: No warning about
ucharclasses package added 33	<b>\@makecaption</b> for more classes 56
v3.5q	\captionsfrench: Redefine
\listFB: Bug correction: \parsep	\fnum@figure and \fnum@table
should be related to \parskip and	separately 53
\listparindent to \parindent 74	v3.5k
v3.5p	General: \degre, \degres,
\DecimalMathComma:	\circonflexe, \tild, \boi and
\DecimalMathComma can again be	<b>\at</b> are now safe in bookmarks 48
used in the preamble for a global	\pdfstringdefDisableCommands
action. It now works as expected	dropped 73
inside a group 49	Reorganise warnings about ':' in
\frquote: \FBeveryline@quote: no	captions, according to
need for a penalty inside a	enhancements in caption.sty
\localleftbox 43	v3.5a

\bsc: \bsc now relies on	v3.5f
\texorpdfstring to be safe in	General: \1@canadien was defined too
bookmarks 48	early in file 'canadien.ldf':
\captionsfrench: Small caps	\1@acadian might not be defined. 15
removed in \figurename and	\selectlanguage{canadien}
\tablename, use \fnum@figure	allowed again only for backward
and \fnum@table instead 53	compatibility (deprecated) 86
\FB@fg: \FB@og and \FB@fg now rely	\DecimalMathComma: Fixed bug with
on <b>\texorpdfstring</b> to be safe in	the acadian language. Warning
bookmarks 40	added if used with the icomma
\frquote: \frquote now relies on	package 49
\texorpdfstring to be safe in	v3.5e
bookmarks 42	General: StandardLayout and
\fup: \up and \fup now rely on	GlobalLayoutFrench options can
\texorpdfstring to be safe in	no longer be toggled when French
bookmarks 45	is not the main language 60
\no: \no, \nos, \No, \Nos, \primo,	\frquote: Make resettings global on
\fprimo, now rely on	exit
\texorpdfstring to be safe in	new command \NoEveryParQuote. 44
bookmarks 47	reset \FB@addGUILspace attribute
v3.5j	inside \localleftbox (LuaTeX) 43
General: For memoir, koma-script and	v3.5d
beamer captions, <b>\FB@std@sep</b> has	\frenchsetup: ReduceListSpacing
to be defined before activating the	option depreciated: see
colon	StandardListSpacing 62
v3.5i	v3.5c
\frenchsetup: For memoir,	
koma-script and beamer classes,	General: Remove grouping inside
leave caption delimiter unchanged	\@makefntext, \localleftbox and \FBeverypar@quote saved and
if it has been user customised 71	restored instead 83
v3.5h	\frquote: \FBeverypar@quote's value
frenchb.lua: Added glues and	now properly reset across level
penalties should inherit attributes	changes
from the related punctuation	_
character; this is mandatory for	\noextrasfrench: \lccode of quote 0x27 changed from 0x2019 to 0x27
Lua-UL to underline and highlight	for Unicode engines 17
them. Thanks to Marcel Krüger for	v3.5b
providing the fix	
Code reorganised for better	General: Reset \FBeverypar@quote
efficiency 26	locally inside \@makefntext.  Needed by \frquote 83
v3.5g	• •
<pre>frenchb.lua: The kerning callback is   a bit specific: adding code with</pre>	\frquote: New command \FB@addquote@everypar to
add_to_callback actually deletes	manage \everypar: \frquote failed when used immediately
the legacy kerning as pointed out	
by Marcel Krüger on SE 26	after a sectionning command 42

v3.5a	too: \AtEndOfPackage is too late. 60
General: New optional layout for lists:	Shrink/stretch removed in
lists' items can be typeset as	\FBthousandsep 52
paragraphs with indented labels	Toks \FBcolonsp, \FBthinsp and
while the default leaves the labels	\FBguillsp removed 18
hanging into the left margin 76	\datefrench: Specific code for Plain
\descriptionFB: ListItemsAsPar	finally removed (babel bug
option taken into account for	reported) 44
description lists 78	\extrasfrench: Change
\frenchsetup: New option	\(no)extras\CurrentOption to
ListItemsAsPar for displaying lists'	\(no)extrasfrench.
items "as paragraphs" 62	\(no)extrasacadian will be
v3.4d	defined as \(no)extrasfrench in
\frenchsetup: New test for deciding	file acadian.ldf 16
about utf8 encoding for keys og	frenchb.lua: Global 'FBsp' table
and fg (the former one fails with	added; local function 'get_glue'
LaTeX 2018 release) 66	changed into global 'FBget_glue'. 24
v3.4c	v3.3d
\ifFBXeTeX: Reverting to former test,	frenchb.lua: In default mode, for ':'
beware of \XeTeXrevision left as	only, check if next node is a glyph
\relax by careless testing 16	or not. If it is, turn the 'auto' flag to
v3.4b	false (avoids spurious spaces in
\datefrench: Do not redefine \date	URLs, MSDOS paths or 10:35) 27
as \frenchdate in French 44	v3.3c
v3.4a	General: LaTeX 2017-04-15 defines TU
General: \LdfInit checks	encoding for Unicode engines,
\FBclean@on@exitinstead of	fontspec is no longer required 74
\captionsfrench (undefined in	New command \FBthousandsep to
PLain). Prevents loading french.ldf	customise numprint 52
again with acadian option 14	New configurable kerns \FBmedkern,
babel-french now requires eTeX 14	and <b>\FBthickkern</b> suitable for
Lua function token.get_meaning	HTML translation 47
requires LuaTeX 1.0 22	Reorganise warnings when the
New \FBgspchar to customise the	caption, subcaption or floatrow
space character to be used for \og	packages are loaded before
and\fg with the	babel/french 56
UnicodeNoBreakSpaces option 40	Reset \localleftbox locally inside
New attribute \FB@dialect for the	\@makefntext. Needed by
French dialect acadian 21	\frquote with LuaTeX 83
New command <b>\FBsetspaces</b> to	\frenchsetup: New option
fine tune spacing independently in	'UnicodeNoBreakSpaces' for html
French and in French dialects 18	translators (LuaLaTeX only) 65
Patch for koma-script classes	frenchb.lua: Function 'get_glue'
moved here, after	robustified. 'french_punctuation'
\ifFBPartNameFull is defined, so	can insert Unicode characters
that it applies to \extrasacadian	instead of glues 23

v3.3b	\captionsfrench: Commands
General: Generate portmanteau files acadian.ldf, canadien.ldf,	\frenchpartfirst, \frenchpartsecond and
frenchb.ldf, and francais.ldf and warn about deprecated options	\frenchpartnameord added 53 \FBthinspace: Skips \FBcolonskip and \FBthinskip replaced by toks \FBcolonsp and \FBthinsp 18
\iflanguage test which is based on patterns 16	\frenchsetup: \frenchbsetup is now an alias for \frenchsetup 62
General: Compatibility code for pre 2015/10/01 LaTeX release removed, see ltnews23.tex	Options INGuillSpace, ThinColonSpace no longer delayed AtBeginDocument 62
Skip \FBguillskip for LuaTeX replaced by toks \FBguillsp 18	\frquote: \FB@quotespace (kern), changed into \FB@guillspace 42
