202 INTRODUCTION TFtoPL changes for C $\S 1$

1.* Introduction. The TFtoPL utility program converts TEX font metric ("TFM") files into equivalent property-list ("PL") files. It also makes a thorough check of the given TFM file, using essentially the same algorithm as TEX. Thus if TEX complains that a TFM file is "bad," this program will pinpoint the source or sources of badness. A PL file output by this program can be edited with a normal text editor, and the result can be converted back to TFM format using the companion program PLtoTF.

The first TFtoPL program was designed by Leo Guibas in the summer of 1978. Contributions by Frank Liang, Doug Wyatt, and Lyle Ramshaw also had a significant effect on the evolution of the present code.

Extensions for an enhanced ligature mechanism were added by the author in 1989.

The banner string defined here should be changed whenever TFtoPL gets modified.

```
define my\_name \equiv \texttt{`tftopl`}
define banner \equiv \texttt{`This}_i \texttt{s}_i \texttt{TFtoPL},_i \texttt{Version}_i \texttt{3.3`} { printed when the program starts }
```

2.* This program is written entirely in standard Pascal, except that it occasionally has lower case letters in strings that are output. Such letters can be converted to upper case if necessary. The input is read from tfm_file , and the output is written on pl_file ; error messages and other remarks are written on the output file, which the user may choose to assign to the terminal if the system permits it.

The term *print* is used instead of *write* when this program writes on the *output* file, so that all such output can be easily deflected.

```
define print(\#) \equiv write(stderr, \#)
  define print_{-}ln(\#) \equiv write_{-}ln(stderr, \#)
      Tangle doesn't recognize @ when it's right after the =. }
  @\|_@define_var_tfm;|@\
program TFtoPL(tfm_file, pl_file, output);
  const \langle Constants in the outer block 4^*\rangle
  type \langle Types in the outer block 18^*\rangle
  var (Globals in the outer block 6)
     \langle \text{ Define } parse\_arguments \ 100^* \rangle
  procedure initialize; { this procedure gets things started properly }
    begin kpse_set_program_name(argv[0], my_name); kpse_init_prog(`TFTOPL`, 0, nil, nil);
          { We xrealloc when we know how big the file is. The 1000 comes from the negative lower bound. }
    tfm\_file\_array \leftarrow xmalloc\_array(byte, 1002); parse\_arguments; \langle Set initial values 7^* \rangle
    end:
   If the program has to stop prematurely, it goes to the 'final_end'.
  define final\_end = 9999 { label for the end of it all }
    The following parameters can be changed at compile time to extend or reduce TFtoPL's capacity.
\langle \text{ Constants in the outer block } 4^* \rangle \equiv
  lig\_size = 32510; { maximum length of lig\_kern program, in words (< 2^{15})}
  hash\_size = 32579;
       { preferably a prime number, a bit larger than the number of character pairs in lig/kern steps }
See also section 108*.
```

This code is used in section 2*.

 $\S6$ TFtoPL changes for C FONT METRIC DATA 203

7.* On some systems you may have to do something special to read a packed file of bytes. With C under Unix, we just open the file by name and read characters from it.

```
⟨ Set initial values 7*⟩ ≡
    tfm_file ← kpse_open_file(tfm_name, kpse_tfm_format);
    if verbose then
        begin print(banner); print_ln(version_string);
        end;

See also sections 17*, 28*, 33, 46, and 64.

This code is used in section 2*.

17* If an explicit filename isn't given, we write to stdout.
⟨ Set initial values 7*⟩ +≡
    if optind + 1 = argc then
        begin pl_file ← stdout;
    end
    else begin pl_name ← extend_filename(cmdline(optind + 1), `pl`); rewrite(pl_file, pl_name);
    end;
```

204

18* Unpacked representation. The first thing TFtoPL does is read the entire *tfm_file* into an array of bytes, tfm[0..(4*lf-1)].**define** $index \equiv index_type$ \langle Types in the outer block $18*\rangle \equiv$ byte = 0...255; { unsigned eight-bit quantity } index = integer; { address of a byte in tfm } See also section 107*. This code is used in section 2^* . \langle Globals in the outer block $6\rangle + \equiv$ { Kludge here to define tfm as a macro which takes care of the negative lower bound. We've defined tfm for the benefit of web2c above. } $\#define_{\perp}tfm_{\perp}(tfmfilearray_{\perp}+_{\perp}1001); @ \tfm_file_array: \uparrow byte; { the input data all goes here }$ { the negative addresses avoid range checks for invalid characters } 20.* The input may, of course, be all screwed up and not a TFM file at all. So we begin cautiously. **define** $abort(\#) \equiv$ **begin** $print_ln(\#)$; print_ln(`Sorry,_but_|I_can`´t_go_on;_are_you_sure_this_is_a_TFM?´); goto final_end; end \langle Read the whole input file $20^*\rangle \equiv$ $read(tfm_file, tfm[0]);$ if tfm[0] > 127 then $abort(`The_lfirst_lbyte_lof_lthe_linput_lfile_lexceeds_l127!`);$ if $eof(tfm_file)$ then $abort(`The_{\sqcup}input_{\sqcup}file_{\sqcup}is_{\sqcup}only_{\sqcup}one_{\sqcup}byte_{\sqcup}long!`);$ $read(tfm_file, tfm[1]); lf \leftarrow tfm[0] * '400 + tfm[1];$ if lf = 0 then $abort(`The_lfile_lclaims_lto_lhave_length_zero,_lbut_lthat``s_limpossible!`);$ $tfm_file_array \leftarrow xrealloc_array(tfm_file_array, byte, 4 * lf + 1000);$ for $tfm_ptr \leftarrow 2$ to 4*lf - 1 do begin if eof(tfm_file) then abort('Theufileuhasufewerubytesuthanuituclaims!'); $read(tfm_file, tfm[tfm_ptr]);$ end; if $\neg eof(tfm_file)$ then begin $print_ln($ There $s_lsome_lextral_junk_lat_lthe_lend_lof_lthe_lTFM_lfile, <math>s_lsome_lextral_junk_lat_lthe_lend_lof_lthe_lsome_lextral_junk_lat_lthe_lend_lof_lthe_lsome_lextral_junk_lat_lthe_lend_lof_lthe_lsome_lextral_junk_lat_lthe_lend_lof_lthe_lsome_lextral_junk_lat_lthe_lend_lof_lthe_lsome_lextral_junk_lat_lthe_lend_lof_lthe_lsome_lextral_junk_lat_lthe_lsome_lextral_junk_lat_lthe_lsome_lextral_junk_lat_lthe_lsome_lextral_junk_lat_lthe_lsome_lextral_junk_lat_lthe_lsome_lsome_lextral_junk_lat_lthe_lsome$

This code is used in section 96.

end

print_ln('but_I''ll_proceed_as_if_it_weren''t_there.');

27.* In order to stick to standard Pascal, we use three strings called ASCII_04, ASCII_10, and ASCII_14, in terms of which we can do the appropriate conversion of ASCII codes. Three other little strings are used to produce face codes like MIE.

```
\langle Globals in the outer block 6\rangle + \equiv
ASCII_04, ASCII_10, ASCII_14: const_c_string; { strings for output in the user's external character set }
ASCII_{-}all: packed array [0...256] of char;
MBL_string, RI_string, RCE_string: const_c_string; { handy string constants for face codes }
28* \langle Set initial values 7^* \rangle + \equiv
  ASCII_{-}04 \leftarrow `_{\sqcup\sqcup}!"#\$\%\&``()*+,-./0123456789:;<=>?`;
  ASCII_{-}10 \leftarrow `\square @ABCDEFGHIJKLMNOPQRSTUVWXYZ[\]`_`;
  ASCII_{-}14 \leftarrow `\Box` abcdefghijklmnopqrstuvwxyz{|}``\Box`;
  strcpy(ASCII\_all, ASCII\_04); strcat(ASCII\_all, `QABCDEFGHIJKLMNOPQRSTUVWXYZ[\]^_);
  strcat(ASCII_all, ``abcdefghijklmnopqrstuvwxyz{|}``);
  MBL\_string \leftarrow `\_MBL`; RI\_string \leftarrow `\_RI\_`; RCE\_string \leftarrow `\_RCE`;
38.* The property value may be a character, which is output in octal unless it is a letter or a digit. This
procedure is the only place where a lowercase letter will be output to the PL file.
procedure out\_char(c:byte); { outputs a character }
  begin if (font\_type > vanilla) \lor (charcode\_format = charcode\_octal) then
     begin tfm[0] \leftarrow c; out\_octal(0,1)
     end
  else if (charcode\_format = charcode\_ascii) \land (c > " \sqcup ") \land (c \leq " \tilde{} ") \land (c \neq " (") \land (c \neq ")") then
        out(`_{\sqcup}C_{\sqcup}`, ASCII_{\_}all[c - "_{\sqcup}" + 1]) { default case, use C only for letters and digits }
     else if (c \geq "0") \land (c \leq "9") then out(` \cup C \cup `, c - "0" : 1)
       else if (c \geq "A") \land (c \leq "Z") then out(` \cup C \cup `, ASCII\_10[c - "A" + 2])
          else if (c \geq "a") \land (c \leq "z") then out(\lceil C \rceil, ASCII_1/[c - "a" + 2])
             else begin tfm[0] \leftarrow c; out\_octal(0,1);
               end;
  end;
39. The property value might be a "face" byte, which is output in the curious code mentioned earlier,
provided that it is less than 18.
procedure out\_face(k:index); { outputs a face }
  \mathbf{var}\ s:\ 0\dots 1;\ \{\text{the slope}\}\
```

```
b: 0...8; { the weight and expansion }
begin if tfm[k] \ge 18 then out\_octal(k, 1)
else begin out( ` \Box F \Box `); { specify face-code format }
  s \leftarrow tfm[k] \bmod 2; b \leftarrow tfm[k] \operatorname{div} 2; put\_byte(MBL\_string[1 + (b \bmod 3)], pl\_file);
  put\_byte(RI\_string[1+s], pl\_file); put\_byte(RCE\_string[1+(b \operatorname{\mathbf{div}} 3)], pl\_file);
  end;
end;
```

206 DOING IT TFtoPL changes for C $\S44$

78.* The last thing on TFtoPL's agenda is to go through the list of *char_info* and spew out the information about each individual character.

```
\langle \text{ Do the characters } 78^* \rangle \equiv
  sort_ptr \leftarrow 0; { this will suppress 'STOP' lines in ligature comments }
  for c \leftarrow bc to ec do
    if width_index(c) > 0 then
       begin if chars\_on\_line = 8 then
          begin print_ln(` \Box `); chars_on_line \leftarrow 1;
       else begin if chars\_on\_line > 0 then print(`\_');
         if verbose then incr(chars_on_line);
         end:
       if verbose then print\_octal(c); { progress report }
       left; out('CHARACTER'); out_char(c); out_ln; \( \) Output the character's width 79 \( \);
       if height\_index(c) > 0 then \( Output the character's height 80 \);
       if depth\_index(c) > 0 then \langle Output the character's depth 81 <math>\rangle;
       if italic\_index(c) > 0 then \langle Output the italic correction 82 \rangle;
       case tag(c) of
       no\_tag: do\_nothing;
       lig_tag: (Output the applicable part of the ligature/kern program as a comment 83);
       list_tag: (Output the character link unless there is a problem 84);
       ext_tag: (Output an extensible character recipe 85);
       end; { there are no other cases }
       right;
       end
```

This code is used in section 98.

89.* To detect such loops, TFtoPL attempts to evaluate the function f(x, y) for all character pairs x and y, where f is defined as follows: If the current character is x and the next character is y, we say the "cursor" is between x and y; when the cursor first moves past y, the character immediately to its left is f(x, y). This function is defined if and only if no infinite loop is generated when the cursor is between x and y.

The function f(x,y) can be defined recursively. It turns out that all pairs (x,y) belong to one of five classes. The simplest class has f(x,y) = y; this happens if there's no ligature between x and y, or in the cases LIG/> and /LIG/>>. Another simple class arises when there's a LIG or /LIG> between x and y, generating the character z; then f(x,y) = z. Otherwise we always have f(x,y) equal to either f(x,z) or f(z,y) or f(f(x,z),y), where z is the inserted ligature character.

The first two of these classes can be merged; we can also consider (x, y) to belong to the simple class when f(x, y) has been evaluated. For technical reasons we allow x to be 256 (for the boundary character at the left) or 257 (in cases when an error has been detected).

For each pair (x, y) having a ligature program step, we store (x, y) in a hash table from which the values z and class can be read.

```
define simple = 0 { f(x,y) = z } define left_z = 1 { f(x,y) = f(z,y) } define right_z = 2 { f(x,y) = f(x,z) } define both_z = 3 { f(x,y) = f(f(x,z),y) } define both_z = 3 { f(x,y) = f(f(x,z),y) } define pending = 4 { f(x,y) is being evaluated } define class \equiv class\_var \langle Globals in the outer block 6 \rangle + \equiv hash: array [0 ... hash\_size] of 0 ... 66048; { 256x + y + 1 for x \le 257 and y \le 255 } class: array [0 ... hash\_size] of simple ... pending; lig\_z: array [0 ... hash\_size] of 0 ... 257; hash\_ptr: 0 ... hash\_size; { the number of nonzero entries in hash } hash\_list: array [0 ... hash\_size] of 0 ... hash\_size; { list of those nonzero entries } h, hh: 0 ... hash\_size; { indices into the hash table } x\_lig\_cycle, y\_lig\_cycle: 0 ... 256; { problematic ligature pair }
```

208

```
90* \langle Check for ligature cycles 90^* \rangle \equiv
  hash\_ptr \leftarrow 0; \ y\_lig\_cycle \leftarrow 256;
  for hh \leftarrow 0 to hash\_size do hash[hh] \leftarrow 0; { clear the hash table }
  for c \leftarrow bc to ec do
     if tag(c) = lig_{-}tag then
       begin i \leftarrow remainder(c);
       if tfm[lig\_step(i)] > stop\_flag then i \leftarrow 256 * tfm[lig\_step(i) + 2] + tfm[lig\_step(i) + 3];
        \langle Enter data for character c starting at location i in the hash table 91\rangle;
       end:
  if bchar\_label < nl then
     begin c \leftarrow 256; i \leftarrow bchar\_label;
     \langle Enter data for character c starting at location i in the hash table 91\rangle;
     end:
  if hash\_ptr = hash\_size then
     begin print_ln(`Sorry, _I_haven``t_room_for_so_many_ligature/kern_pairs!`); uexit(1); ;
  \textbf{for } hh \leftarrow 1 \textbf{ to } hash\_ptr \textbf{ do}
     begin r \leftarrow hash\_list[hh];
     if class[r] > simple then { make sure f is defined }
       r \leftarrow f_{-}f_{n}(r, (hash[r] - 1) \operatorname{div} 256, (hash[r] - 1) \operatorname{mod} 256);
     end;
  if y_lig_cycle < 256 then
     begin print('Infinite_ligature_loop_starting_with_');
     if x\_liq\_cycle = 256 then print(`boundary`) else print\_octal(x\_liq\_cycle);
     print(` uand u`); print_octal(y_lig_cycle); print_ln(`!`);
     out('(INFINITE_LIGATURE_LOOP_MUST_BE_BROKEN!)'); uexit(1);
     end
This code is used in section 66.
94.* Evaluation of f(x,y) is handled by two mutually recursive procedures. Kind of a neat algorithm,
generalizing a depth-first search.
  ifdef('notdef')
  function f_{-}fn(h, x, y : index): index;
     begin end;
     { compute f for arguments known to be in hash[h] }
endif('notdef')
function eval(x, y : index): index; { compute f(x, y) with hashtable lookup }
  var key: integer; { value sought in hash table }
  begin key \leftarrow 256 * x + y + 1; h \leftarrow (1009 * key) \bmod hash\_size;
  while hash[h] > key do
     if h > 0 then decr(h) else h \leftarrow hash\_size;
  if hash[h] < key then eval \leftarrow y { not in ordered hash table }
  else eval \leftarrow f_{-}fn(h, x, y);
  end;
```

CHECKING FOR LIGATURE LOOPS

95.* Pascal's beastly convention for forward declarations prevents us from saying function f(h, x, y : index): index here.

```
function f\_fn(h, x, y : index): index;

begin case class[h] of

simple: do\_nothing;

left\_z: begin class[h] \leftarrow pending; lig\_z[h] \leftarrow eval(lig\_z[h], y); class[h] \leftarrow simple;

end;

right\_z: begin class[h] \leftarrow pending; lig\_z[h] \leftarrow eval(x, lig\_z[h]); class[h] \leftarrow simple;

end;

both\_z: begin class[h] \leftarrow pending; lig\_z[h] \leftarrow eval(eval(x, lig\_z[h]), y); class[h] \leftarrow simple;

end;

pending: begin x\_lig\_cycle \leftarrow x; y\_lig\_cycle \leftarrow y; lig\_z[h] \leftarrow 257; class[h] \leftarrow simple;

end; { the value 257 will break all cycles, since it's not in hash }

end; { there are no other cases }

f\_fn \leftarrow lig\_z[h];

end;
```

210 THE MAIN PROGRAM TFtoPL changes for C $\S96$

99* Here is where TFtoPL begins and ends.

```
(Build the label table 67) Used in section 66.
 Check and output the ith parameter 60 Used in section 58.
 Check for a boundary char 69 \ Used in section 66.
 Check for ligature cycles 90^* Used in section 66.
 Check the extensible recipes 87 Used in section 99^*.
 Check the fix-word entries 62 Used in section 97.
 Check to see if np is complete for this font type 59
                                                          Used in section 58.
 Compute the base addresses 23 \ Used in section 96.
 Compute the command parameters y, cc, and zz 93 Used in section 92.
 Compute the activity array 70 Used in section 66.
 Constants in the outer block 4^*, 108^* Used in section 2^*.
 Define the option table 101^*, 102^*, 103^*, 106^*, 111^* Used in section 100^*.
 Define parse\_arguments\ 100^* Used in section 2*.
 Do the characters 78* Used in section 98.
 Do the header 48 Used in section 97.
 Do the ligatures and kerns 66 \ Used in section 99^*.
 Do the parameters 58 Used in section 97.
 Enter data for character c starting at location i in the hash table 91 \rangle Used in sections 90* and 90*.
 Globals in the outer block 6, 8, 16, 19*, 22, 25, 27*, 29, 32, 45, 47, 63, 65, 89*, 104*, 109*, 112* Used in section 2*.
 Initialize the option variables 105^*, 110^* Used in section 100^*.
 Insert (c, r) into label\_table 68 \rangle Used in section 67.
 Output a kern step 76 \ Used in section 74.
 Output a ligature step 77 \> Used in section 74.
 Output an extensible character recipe 85 \ Used in section 78*.
 Output and correct the ligature/kern program 71 \ Used in section 66.
 Output any labels for step i 72 \ Used in section 71.
 Output either SKIP or STOP 75 \ Used in section 74.
 Output step i of the ligature/kern program 74 Used in sections 71 and 83.
 Output the applicable part of the ligature/kern program as a comment 83 \ Used in section 78*.
 Output the character coding scheme 54 \ Used in section 48.
 Output the character link unless there is a problem 84 \ Used in section 78^*.
 Output the character's depth 81 \ Used in section 78*.
 Output the character's height 80 \ Used in section 78*.
 Output the character's width 79 \ Used in section 78*.
 Output the check sum 49 Used in section 48.
 Output the design size 51 Vsed in section 48.
 Output the extensible pieces that exist 86 \ Used in section 85.
 Output the family name 55 \ Used in section 48.
 Output the fraction part, f/2^{20}, in decimal notation 42 \rangle Used in section 40.
 Output the integer part, a, in decimal notation 41 \rangle Used in section 40.
 Output the italic correction 82 Used in section 78*.
 Output the name of parameter i 61 \ Used in section 60.
 Output the rest of the header 56 Used in section 48.
 Output the seven\_bit\_safe\_flag 57 \ Used in section 48.
 Read the whole input file 20^* Used in section 96.
 Reduce l by one, preserving the invariants 37 \ Used in section 36.
 Reduce negative to positive 43 \rangle Used in section 40.
 Set initial values 7^*, 17^*, 28^*, 33, 46, 64 Used in section 2^*.
 Set subfile sizes lh, bc, \ldots, np 21 \rangle Used in section 96.
 Set the true font\_type 53 Used in section 48.
 Take care of commenting out unreachable steps 73 \ Used in section 71.
\langle \text{Types in the outer block } 18^*, 107^* \rangle Used in section 2^*.
```
